Foreword

The Southern Standard Building Code is promulgated by The Southern Building Code Congress. The Congress is a non-political, non-profit Southern Municipal Association. Its finances are derived from annual membership fees.

We believe that the building progress of the South can best be served by a Modern Building Code, written and maintained up-to-date by a Southern Association.

Table of Contents

CHAPTER I — ADMINISTRATION

CHAPTER III — FIRE DISTRICTS

SECTION	301	GENERAL BUILDING RESTRICTIONS
	302	CHANGES TO BUILDINGS
	303	BUILDINGS LOCATED IN TWO DISTRICTS
	304	EXCEPTIONS TO RESTRICTIONS IN FIRE DISTRICTS

CHAPTER IV — CLASSIFICATION OF BUILDINGS BY OCCUPANCY

SECTION	401	CLASSIFICATION BY OCCUPANCY OR USE
	402	HEIGHT AND AREA RESTRICTIONS
	403	EXCEPTIONS TO AREA RESTRICTIONS
	404	GROUP "A" RESIDENTIAL
	405	GROUP "B" BUSINESS
	406	GROUP "C" SCHOOLS
	407	GROUP "D" INSTITUTIONAL
	408	GROUP "E" ASSEMBLY
	409	GROUP "F" STORAGE
	410	GROUP "G" INDUSTRIAL
	411	GROUP "H" HAZARDOUS
	412	SEPARATION REQUIREMENTS

CHAPTER V — SPECIAL OCCUPANCY REQUIREMENTS

SECTION	501	GROUP "H" HAZARDOUS OCCUPANCIES
	502	AIRPLANE HANGARS

- 503 COAL POCKETS
- 504 TEMPORARY STRUCTURES
- 505 FILLING STATIONS
- 506 PRIVATE GARAGES
- 507 PARKING LOTS
- 508 PUBLIC GARAGES
- 509 GREENHOUSES
- 510 STADIUMS AND GRANDSTANDS
- 511 AMUSEMENT PARK BUILDINGS
- 512 ASSEMBLY OCCUPANCIES
- 513 BOWLING ALLEYS
- 514 CHURCHES

CHAPTER VI — CLASSIFICATION OF BUILDINGS BY CONSTRUCTION

- SECTION 601 CLASSIFICATION BY TYPE OF CONSTRUCTION
- 602 TYPE I—FIREPROOF CONSTRUCTION
- 603 TYPE II—FIRE-RESISTIVE CONSTRUCTION
- 604 TYPE III—HEAVY TIMBER CONSTRUCTION
- 605 TYPE IV—NON-COMBUSTIBLE FRAME
CONSTRUCTION
- 606 TYPE V—ORDINARY CONSTRUCTION
- 607 TYPE VI—WOOD FRAME CONSTRUCTION
- 608 EXCEPTIONS TO FIRE PROTECTION
- 609 MIXED TYPES OF CONSTRUCTION

CHAPTER VII — FIRE PROTECTION REQUIREMENTS

- SECTION 701 PROTECTION OF VERTICAL OPENINGS, STAIRS
AND ELEVATORS
- 702 PARTITIONS
- 703 PROTECTION OF WALL OPENINGS
- 704 RESTRICTIONS ON INTERIOR USE OF
COMBUSTIBLE MATERIALS
- 705 FIRESTOPPING
- 706 ROOF COVERINGS
- 707 SKYLIGHTS
- 708 MANSARD OR SLANTING ROOFS
- 709 DORMER WINDOWS
- 710 CORNICES, BALCONIES, BAY WINDOWS
- 711 GUTTERS AND LEADERS
- 712 TOWERS, SPIRES, CUPOLAS, AERIAL SUPPORTS,
POLES, ETC.
- 713 TANKS
- 714 COOLING TOWERS
- 715 DRYING ROOMS

CHAPTER VIII — HEATING

- SECTION 801 GENERAL
802 CHIMNEYS
803 MEDIUM TEMPERATURE REQUIREMENTS
804 HIGH TEMPERATURE REQUIREMENTS
805 HEATING, AIR CONDITIONING AND VENTILATING DUCTS
806 STEAM AND HOT WATER PIPES
807 FIRE PROTECTION OF MISCELLANEOUS HEATING DEVICES
808 FUEL OIL AND COMPRESSED GAS SYSTEMS
809 GAS FEED LINES

CHAPTER IX — SPRINKLERS AND STANDPIPES

- SECTION 901 SPRINKLERS
902 STANDPIPES

CHAPTER X — FIRE-RESISTIVE RATINGS FOR MATERIALS AND CONSTRUCTION

- SECTION 1001 GENERAL
1002 FIRE-RESISTANCE RATINGS FOR WALLS AND PARTITIONS
1003 FIRE-RESISTANCE RATINGS FOR PROTECTED STEEL COLUMNS
1004 FIRE-RESISTANCE RATINGS FOR PROTECTED STEEL BEAMS, GIRDERS AND TRUSSES
1005 FIRE-RESISTANCE RATINGS FOR REINFORCED CONCRETE COLUMNS, BEAMS, GIRDERS AND TRUSSES
1006 FIRE-RESISTANCE RATINGS FOR TIMBER COLUMNS
1007 FIRE-RESISTANCE RATINGS FOR FLOOR AND ROOF CONSTRUCTION
1008 MATERIALS FOR FIRE PROTECTION

CHAPTER XI — EXIT REQUIREMENTS

- SECTION 1101 GENERAL PROVISIONS
1102 PERMISSIBLE EXITS
1103 NUMBER AND ARRANGEMENT OF EXITS
1104 SPECIAL EXIT REQUIREMENTS
1105 CAPACITY OF EXIT STAIRWAYS
1106 EXIT ENCLOSURES
1107 EXIT OUTLETS
1108 STAIRWAY CONSTRUCTION

- 1109 FIRE ESCAPES
- 1110 DOORWAYS
- 1111 PASSAGeways AND CORRIDORS
- 1112 RAMPS
- 1113 HORIZONTAL EXITS
- 1114 EXIT TO ROOF
- 1115 ELEVATORS
- 1116 ESCALATORS OR MOVING STAIRS
- 1117 EXIT SIGNS
- 1118 ILLUMINATION OF EXITS
- 1119 FIRE ALARM

CHAPTER XII — MINIMUM DESIGN LOADS

- SECTION 1201 GENERAL
- 1202 DEAD LOADS
- 1203 LIVE LOADS
- 1204 SPECIAL LOADS
- 1205 WIND LOADS
- 1206 SEATING CAPACITY POSTED
- 1207 OCCUPANCY PERMITS FOR CHANGED FLOOR LOADING

CHAPTER XIII — FOUNDATIONS EXCAVATIONS, FOOTINGS AND FOUNDATIONS

- SECTION 1301 EXCAVATIONS
- 1302 FOOTINGS AND FOUNDATIONS
- 1303 PILES
- 1304 CAISSONS

CHAPTER XIV — MASONRY AND VENEERED WALLS

- SECTION 1401 GENERAL
- 1402 MATERIALS
- 1403 WORKING STRESSES
- 1404 MINIMUM WALL THICKNESS
- 1405 LATERAL SUPPORT

CHAPTER I—ADMINISTRATION

SECTION 101—TITLE AND SCOPE

101.1 — TITLE

The provisions embraced within the following chapters and sections shall constitute and be known and may be cited as "The Building Code" hereinafter referred to as "this code."

101.2 — CODE REMEDIAL

This code is hereby declared to be remedial, and shall be construed to secure the beneficial interests and purposes thereof—which are public safety, health, and general welfare—through structural strength, stability, sanitation, adequate light and ventilation, and safety to life and property from fire and other hazards incident to the construction, alteration, repair, removal, demolition, use and occupancy of buildings, structures, or premises.

101.3 — SCOPE

(a) The provisions of this code shall apply to the construction, alteration, repair, equipment, use and occupancy, location, maintenance, removal and demolition, of every building or structure or any appurtenances connected or attached to such buildings or structures.

(b) No provision of this code shall be held to deprive any federal or state agency, or any municipal authority having jurisdiction, of any power or authority which it had on the effective date of this act or of any remedy then existing for the enforcement of its orders, nor shall it deprive any individual or corporation of its legal rights as provided by law.

101.4 — EXISTING BUILDINGS

(a) If, within any period of twelve months, alterations or repairs costing in excess of fifty percent of the then physical value of the building are made to an existing building, such building shall be made to conform to the requirements of this code for new buildings, except that for buildings located in fire districts the provisions of Sections 302.1 and 302.2 shall apply.

(b) If an existing building is damaged by fire or otherwise in excess of fifty percent of its then physical value before such damage is repaired, it shall be made to conform to the requirements of this code for new buildings.

(c) If the cost of such alterations or repairs, or the amount of such damage, is more than twenty-five but not more than fifty percent of the then physical value of the building, the portions to be altered or repaired shall be made to conform to the requirements of this code for new buildings to such extent as the Building Official may determine.

(d) For the purpose of this section physical value of the building shall be determined by the Building Official.

(e) If the occupancy of an existing building is entirely changed, the building shall be made to conform to the requirements of this code for the new occupancy. If the occupancy of only a portion of an existing building is changed and that portion is separated from the remainder as specified in Section 412, then only such portion need be made to conform.

(f) Repairs and alterations, not covered by the preceding paragraphs of this section, restoring a building to its condition previous to damage or deterioration, or altering it in conformity with the provisions of this code or in such manner as will not extend or increase an existing non-conformity or hazard, may be made with the same kind of materials as those of which the building is constructed; but not more than twenty-five percent of the roof covering of a building shall be replaced in any period of twelve months unless the entire roof covering is made to conform with the requirements of this code for new buildings.

101.5 — MAINTENANCE

All buildings or structures, both existing and new, and all parts thereof, shall be maintained in a safe and sanitary condition. All devices or safeguards which are required by this code in a building when erected, altered, or repaired, shall be maintained in good working order. The owner, or his designated agent, shall be responsible for the maintenance of buildings and structures.

SECTION 102—ORGANIZATION

102.1 — BUILDING OFFICIAL

(a) There is hereby established in the City a department to be called the Building Department, which shall be in charge of a Building Official.

(b) The Building Official shall have had at least ten years' experience as an architect, engineer, building inspector, building contractor, or superintendent of building construction, for five years of which he shall have been in responsible charge of work. He shall be appointed by the Chief Appointing Authority of the municipality. His appointment shall continue during good behavior and satisfactory service. He shall not be removed from office except for cause after full opportunity has been given him to be heard on specific charges before such Chief Appointing Authority.

102.2 — INSPECTORS

The Building Official, with the approval of the Chief Appointing Authority of the municipality, may appoint such number of officers, inspectors, assistants, and other employees as shall be authorized from time to time. No person shall be appointed as inspector of construction who has not had at least five years' experience as a Building Inspector, builder, engineer, architect, or as a superintendent, foreman, or competent mechanic in charge of construction.

102.3 — DEPUTY

The Building Official may designate as his deputy an employee in the department who shall, during the absence or disability of the Building Official exercise all the powers of the Building Official.

102.4 — RESTRICTIONS ON EMPLOYEES

No officer or employee connected with the department, except one whose only connection is as a member of the board, established by this act, shall be financially interested in the furnishing of labor, material, or appliances for the construction, alteration, or maintenance of a building, or in the making of plans or of specifications therefor, unless he is the owner of such building. No such officer or employee shall engage in any work which is inconsistent with his duties or with the interests of the department.

102.5 — RECORDS

The Building Official shall keep, or cause to be kept, a record of the business of the department. The records of the department shall be open to public inspection.

SECTION 103—POWERS AND DUTIES OF BUILDING OFFICIAL

103.1 — RIGHT OF ENTRY

The Building Official shall enforce the provisions of this code, and he, or his duly authorized representative, may enter any building, structure, or premises in the City to perform any duty imposed upon him by this code.

103.2 — STOP WORK ORDERS

Upon notice from the Building Official that work on any building or structure is being done contrary to the provisions of this code or in a dangerous or unsafe manner, such work shall be immediately stopped. Such notice shall be in writing and shall be given to the owner of the property, or to his agent, or to the person doing the work, and shall state the conditions under which work may be resumed. Where an emergency exists, no written notice shall be required to be given by the Building Official.

103.3 — REVOCATION OF PERMITS

The Building Official may revoke a permit or approval, issued under the provisions of this act, in case there has been any false statement or misrepresentation as to a material fact in the application or plans on which the permit or approval was based.

103.4 — UNSAFE BUILDINGS

All buildings or structures which are unsafe, unsanitary, or not provided with adequate egress, or which constitute a fire hazard,

or are otherwise dangerous to human life, or which in relation to existing use constitute a hazard to safety or health by reason of inadequate maintenance, dilapidation, obsolescence, or abandonment, are, severally in contemplation of this section, unsafe buildings. All such unsafe buildings are hereby declared illegal and shall be abated by repair and rehabilitation or by demolition in accordance with the following procedure:

(a) Whenever the Building Official shall find any building or structure or portion thereof to be unsafe, as defined in this section, he shall, in accordance with established procedure for legal notices, give the owner, agent, or person in control of such building or structure written notice stating the defects thereof. This notice shall require the owner within a stated time either to complete specified repairs or improvements, or to demolish and remove the building or structure or portion thereof.

(b) If necessary, such notice shall also require the building, structure or portion thereof to be vacated forthwith and not reoccupied until the specified repairs and improvements are completed, inspected and approved by the Building Official. The Building Official shall cause to be posted at each entrance to such building a notice: "THIS BUILDING IS UNSAFE AND ITS USE OR OCCUPANCY HAS BEEN PROHIBITED BY THE BUILDING OFFICIAL." Such notice shall remain posted until the required repairs are made or demolition is completed. It shall be unlawful for any person, firm or corporation or their agents, or other servants, to remove such notice without written permission of the Building Official, or for any person to enter the building except for the purpose of making the required repairs or of demolishing same.

(c) The owner, agent or person in control shall have the right, except in cases of emergency, to appeal from the decision of the Building Official, as provided hereinafter, and to appear before the Board of Adjustment and Appeals at a specified time and place to show cause why he should not comply with said notice.

(d) In case the owner, agent, or person in control cannot be found within the stated time limit, or, if such owner, agent, or person in control shall fail, neglect, or refuse to comply with notice to repair, rehabilitate, or to demolish and remove said building or structure or portion thereof, the Building Official, after having ascertained the cost, shall cause such building or structure or portion thereof, to be demolished, secured, or required to remain vacant.

(e) The decision of the Building Official shall be final in cases of emergency which, in his opinion, involve imminent danger to human life or health. He shall promptly cause such building, structure, or portion thereof to be made safe or removed. For this purpose he may at once enter such structure or land on which it stands, or abutting land or structures, with such assistance and at such cost as he may deem necessary. He may vacate adjacent structures and protect the public by appropriate fence or such other means as may

be necessary, and for this purpose may close a public or private way.

(f) Costs incurred under paragraphs 103.4(d) and 103.4(e) shall be charged to the owner of the premises involved and shall be collected in the manner provided by law.

103.5 — REQUIREMENTS NOT COVERED BY CODE

Any requirement necessary for the strength or stability of an existing or proposed building or structure, or for the safety of the occupants thereof, not specifically covered by this code, shall be determined by the Building Official subject to appeal to the Board of Adjustments and Appeals.

103.6 — ALTERNATE MATERIALS AND ALTERNATE METHODS OF CONSTRUCTION

The provisions of this code are not intended to prevent the use of any material, or method of construction not specifically prescribed by this code, provided any such alternate has been approved and its use authorized by the Building Official. The Building Official shall approve any such alternate, provided he finds that the proposed design is satisfactory and complies with the provisions of Chapter XII, and that the material, method, or work offered is, for the purpose intended, at least the equivalent of that prescribed in the code in quality, strength, effectiveness, fire-resistance, durability, and safety. The Building Official shall require that sufficient evidence or proof be submitted to substantiate any claims that may be made regarding its use. If, in the opinion of the Building Official, the evidence and proof are not sufficient to justify approval, the applicant may refer the entire matter to the Board of Adjustments and Appeals as specified in Section 111.

103.7 — LIABILITY

Any officer or employee, or member of the Board of Adjustments and Appeals, charged with the enforcement of this code, acting for the City in the discharge of his duties, shall not thereby render himself liable personally, and he is hereby relieved from all personal liability for any damage that may accrue to persons or property as a result of any act required or permitted in the discharge of his duties. Any suit brought against any officer or employee because of such act performed by him in the enforcement of any provision of this code shall be defended by the Department of Law until the final termination of the proceedings.

103.8 — REPORTS

The Building Official shall annually submit a report to the Chief Administrator covering the work of the department during the preceding year. He shall incorporate in said report a summary of the decisions of the Board of Adjustments and Appeals during said year.

SECTION 104—TESTS

The Building Official may require tests or test reports as proof of compliance. Tests, if required, are to be made at the expense of the owner, or his agent, by an approved testing laboratory or other approved agency. Copies of such test reports or the results of all such tests shall be kept on file in the office of the Building Official.

SECTION 105—APPLICATION FOR PERMIT

105.1 — WHEN REQUIRED

(a) Any owner, authorized agent, or contractor who desires to construct, enlarge, alter, repair, move, demolish, or change the occupancy of a building or structure, or to erect, or construct a sign of any description, or to install or alter fire-extinguishing apparatus, elevators, engines, or to install a steam boiler, furnace, heater, incinerator, or other heat producing apparatus, or other appurtenances, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application to the Building Official and obtain the required permit therefor.

(b) A general permit shall carry with it the right to install in any building or structure, or part thereof, heating apparatus, elevators, sidewalk elevators, vaults, chutes, coal holes, lifts, cranes, derricks, steam power boilers, steam, oil, gas or vapor engines, provided the same are shown on the drawings and set forth in the specifications filed with the application for the permit; but where these are not shown on the drawings and covered by the specifications submitted with said application, special permits shall be required.

(c) Ordinary minor repairs may be made with the approval of the Building Official without a permit; provided that such repairs shall not violate any of the provisions of this code.

105.2 — FORM

(a) Each application for a permit with the required fee, shall be filed with the Building Official, on a form furnished by him, and shall contain a general description of the proposed work and its location. The application shall be signed by the owner, or his authorized agent.

(b) Each application for a permit shall indicate the proposed occupancy of all parts of the building and of that portion of the site or lot, if any, not covered by the building or structure, and shall contain such other information as may be required by the Building Official.

105.3 — DRAWINGS AND SPECIFICATIONS

(a) When required by the Building Official, two or more copies of specifications, and of drawings drawn to scale with sufficient clarity and detail to indicate the nature and character of the work, shall

accompany every application. Such drawings and specifications shall contain information, in the form of notes or otherwise, as to the quality of materials, where quality is essential to conformity with this code. Such information shall be specific, and this code shall not be cited as a whole or in part, nor shall the term "legal" or its equivalent be used, as a substitute for specific information.

(b) The Building Official may require details, computations, stress diagrams, and other data necessary to describe the construction and basis of calculations and they shall bear the signature of the person responsible for the design.

(c) All drawings and specifications for buildings and structures shall bear the signature of the owner or his agent.

105.4 — PLOT DIAGRAM

The Building Official shall require drawings showing the location of the proposed building or structure and of every existing building or structure on the site or lot. He may also require a boundary line survey, if necessary, prepared by a qualified surveyor.

105.5 — LIMITATION

An application for a permit for any proposed work shall be deemed to have been abandoned six months after the date of filing, unless before then a permit shall have been issued; provided that, for cause, one or more extensions of time for periods of not exceeding ninety days each may be allowed by the Building Official.

105.6 — EXAMINATION OF DRAWINGS

The Building Official shall examine or cause to be examined each application for permit and the drawings and computations filed therewith and shall ascertain by such examination whether the construction indicated and described is in accordance with the requirements of this code and all other pertinent laws or ordinances. If the plans submitted conform to the laws as to egress, type of construction and general arrangement and are accompanied by drawings showing the structural design, and by a statement that the plans and design conform to the requirements of this code as to strength, stresses, strains, loads and stability and are filed and sworn to by an architect or engineer, the Building Official may without further examination accept such affidavit; provided that the architect or engineer who made such affidavit agrees to submit to the Building Official, on the completion of the structure, a certification that the structure has been erected in accordance with the requirements of this code.

105.7 — STREET LINES

No permit shall be given by the Building Official for the construction of any building, or for the alteration of any building where said building is to be changed and such change will affect the exterior walls, bays, balconies, or other appendages or projections fronting on any street, alley or public lane, or for the placing on any

lot or premises of any building or structure removed from another lot or premises, unless the applicant has made application at the office of the Director of Public Works for the lines of the public street on which he proposes to build, erect or locate said building; and it shall be the duty of the Building Official to see that the street lines are not encroached upon in any manner whatsoever, except as provided for in Chapter XXII.

SECTION 106—PERMITS

106.1 — ACTION ON APPLICATION

(a) If the Building Official is satisfied that the work described in an application for permit and the drawings filed therewith conform to the requirements of this code and other pertinent laws and ordinances, he shall issue a permit therefor to the applicant.

(b) If the application for a permit and the drawings filed therewith describe work which does not conform to the requirements of this code or other pertinent laws or ordinances, the Building Official shall not issue a permit, but shall return the drawings to the applicant with his refusal to issue such permit. Such refusal shall, when requested, be in writing and shall contain the reasons therefor.

106.2—CONTRACTORS LICENSE AND BOND REQUIRED

(a) It shall be the duty of every contractor or builder, who shall make contracts for the erection or construction or repair of buildings for which a permit is required, in the City, and every contractor or builder making such contracts and subletting the same, or any part thereof, to pay a license tax as provided in the general license ordinance, and to register his name in a book provided for that purpose, with the Building official, giving full name, residence and place of business, and, in case of removal from one place to another in the City to have made corresponding change in said register accordingly; and it shall be the further duty of every such person to give good and sufficient bond in the sum of one thousand dollars (\$1,000.00), to be approved by the City Attorney, conditioned to conform to the building regulations, the regulations of this section, and other ordinances of the City in reference to buildings.

106.3 — CONDITIONS OF THE PERMIT

The Building Official shall act upon an application for a permit with plans as filed, or as amended, without unreasonable or unnecessary delay. A permit issued shall be construed to be a license to proceed with the work and shall not be construed as authority to violate, cancel, alter, or set aside any of the provisions of this code, nor shall such issuance of a permit prevent the Building Official from thereafter requiring a correction of errors in plans or in construc-

tion, or of violations of this code. Any permit issued shall become invalid unless the work authorized by it shall have been commenced within six months after its issuance, or if the work authorized by such permit is suspended or abandoned for a period of one year after the time the work is commenced; provided, that, for cause, one or more extensions of time, for periods not exceeding ninety days each, may be allowed in writing by the Building Official.

106.4 — DRAWINGS TO BE KEPT AT SITE

When the Building Official issues a permit, he shall endorse, in writing, or stamp, both sets of plans "Approved." One set of drawings so approved shall be retained by the Building Official and the other set shall be returned to the applicant. The approved drawings shall be kept at the site of work and shall be open to inspection by the Building Official or his authorized representative.

106.5 — PERMITS ISSUED UPON AFFIDAVITS

Whenever a permit is to be issued in reliance upon an affidavit as provided in Section 105.6 or whenever the work to be covered by a permit involves construction under conditions which, in the opinion of the Building Official, are hazardous or complex, the Building Official shall require that the architect or engineer who signed the affidavit or made the drawings or computations shall supervise such work, be responsible for its conformity with the approved drawings, and forthwith upon its completion make and file with the Building Official written affidavit that the work has been done in conformity with the approved plans and with the structural provisions of the code. In the event such architect or engineer is not available, the owner shall employ in his stead a competent person or agency whose qualifications are approved by the Building Official.

106.6 — FOUNDATION PERMITS

When application for permit to erect or enlarge a building has been filed and pending issuance of such permit, the Building Official may, at his discretion, issue a special permit for the foundations of such building. The holder of such a special permit shall proceed at his own risk and without assurance that a permit for the superstructure will be granted.

SECTION 107—FEES

107.1 — GENERAL

No permit shall be issued until the fees prescribed in this section shall have been paid. Nor shall an amendment to a permit be approved until the additional fee, if any, due to an increase in the estimated cost of the building or structure, shall have been paid.

107.2 — FAILURE TO OBTAIN A PERMIT

If any person commences any work on a building or structure before obtaining the necessary permit from the city, he shall be subject to the penalty prescribed herein.

107.3—ACCURATE RECORDS

The Building Official shall keep a permanent and accurate accounting of all permit fees and other monies collected, the names of all persons upon whose account the same was paid, the date and amount thereof.

107.4 — SCHEDULE OF PERMIT FEES

On all buildings, structures or alterations requiring a building permit, as set forth in Section 105, fee shall be paid as required at the time of filing application, in accordance with the following schedule:

(a) Permit Fees

1. Where the valuation does not exceed \$100.00, no fee shall be required, unless an inspection is necessary, in which case there shall be a \$1.50 fee.

2. For a valuation over \$100.00 up to and including \$15,000.00 the fee shall be \$3.00 per thousand or fraction thereof.

3. For a valuation over \$15,000.00 up to and including \$100,000.00, the fee shall be \$45.00 for the first fifteen thousand plus \$2.00 for each additional thousand or fraction thereof.

4. For a valuation over \$100,000.00 up to and including \$500,000.00, the fee shall be \$215.00 for the first one hundred thousand plus \$1.00 for each additional thousand or fraction thereof.

5. For a valuation over \$500,000.00 up to and including \$1,000,000.00, the fee shall be \$615.00 for the first five hundred thousand plus 40c for each additional thousand or fraction thereof.

6. For a valuation over \$1,000,000.00, the fee shall be \$815.00 for the first million plus 15c for each additional thousand or fraction thereof.

(b) Moving of Building or Structures

1. For the moving of any building or structure, the fee shall be \$10.00.

(c) Demolition of Building or Structures

1. For the demolition of any building or structure, the fee shall be \$4.00.

107.5 — BUILDING PERMIT VALUATIONS

If, in the opinion of the Building Official, the valuation of building, alteration, or structure appears to be underestimated on the application, permit shall be denied, unless the applicant can show detailed estimated cost to meet the approval of the Building Official.

SECTION 108—INSPECTIONS

108.1 — INSPECTIONS—GENERAL

(a) Before issuing a permit the Building Official may examine or cause to be examined any building for which an application has been received for permit to enlarge, alter, repair, move, demolish, or change the occupancy thereof. He shall inspect all buildings and structures, from time to time, during and upon completion of the work for which a permit was issued. He shall make a record of every such examination and inspection and of all violations of this code.

(b) When deemed necessary by him, he shall make an inspection of materials or assemblies at the point of manufacture or fabrication. He shall make a record of every such examination and inspection and of all violations of this code.

(c) The Building Official may make, or cause to be made, the inspections called for by these requirements. He may accept reports of inspectors of recognized inspection services provided that after investigation he is satisfied as to their qualifications and reliability. No certificate called for by any provision of these requirements shall be based on such reports unless the same are in writing and certified by a responsible office of such service.

108.2 — INSPECTIONS REQUIRED

(a) The Building Official shall inspect or cause to be inspected at various intervals all construction or work for which a permit is required, and a final inspection shall be made of every building or structure upon completion, prior to the issuance of the Certificate of Occupancy, as required in Section 109.

(b) Work requiring a building permit shall not be commenced until the permit holder or his agent shall have posted the building permit card in a conspicuous place on the front of the premises. The permit shall be protected from the weather and in such position as to permit the Building Official to conveniently make the required entries thereon. This permit card shall be maintained in such position by the permit holder until the Certificate of Occupancy has been issued by the Building Official.

(c) The Building Official upon notification from the permit holder or his agent shall make the following inspections of buildings and such other inspections as may be necessary, and shall either

approve that portion of the construction as completed or shall notify the permit holder or his agent wherein the same fails to comply with the law:

Foundation Inspection: To be made after trenches are excavated and forms erected.

Frame Inspection: To be made after the roof, all framing, fire-blocking and bracing is in place and all pipes, chimneys, and vents are complete.

Final Inspection: To be made after the building is completed and ready for occupancy.

(d) No work shall be done on any part of a building or structure beyond the point indicated in each successive inspection without first obtaining the written approval of the Building Official. Such written approval shall be given only after an inspection shall have been made of each successive step in the construction as indicated by each of the foregoing three inspections.

(e) No reinforcing steel or structural frame work of any part of any building or structure shall be covered or concealed in any manner whatsoever without first obtaining the approval of the Building Official, the designing architect or engineer.

(f) In all buildings where plaster is used for fire protection purposes, the permit holder or his agent shall notify the Building Official after all lathing and backing is in place. No plaster shall be applied until the approval of the Building Official has been received (See Chapter X for Fire Resistive Ratings).

SECTION 109—CERTIFICATE OF OCCUPANCY

109.1 — WHEN REQUIRED

No new building shall be occupied and no change in occupancy of a building or part of a building shall be made until after the Building Official shall have issued a certificate of occupancy therefor.

109.2 — CONTENTS OF CERTIFICATE

Upon completion of a building hereafter erected in accordance with approved plans, and after the final inspection herein referred to, and upon application therefor, the Building Official shall issue a certificate of occupancy stating the nature of the occupancy permitted, the number of persons for each floor when limited by law, the allowable load per square foot for each floor in accordance with the provisions of this code.

109.3 — TEMPORARY OCCUPANCY

A temporary certificate of occupancy may be issued for a portion or portions of a building which may safely be occupied prior to final completion of the building.

109.4 — EXISTING BUILDINGS

A certificate of occupancy for any existing building may be ob-

tained by applying to the Building Official and supplying the information and data necessary to determine compliance with this code for the occupancy intended. Where necessary, in the opinion of the Building Official, two sets of detailed drawings, or a general inspection, or both, may be required. When, upon examination and inspection, it is found that the building conforms to the provisions of this code for such occupancy, a certificate of occupancy shall be issued.

SECTION 110—POSTING FLOOR LOADS

110.1 — FLOOR LOADS

No existing or new building shall be occupied for any purpose which will cause the floors thereof to be loaded beyond their safe capacity. The Building Official may permit occupancy of a building for mercantile, commercial, or industrial purposes, by a specific business, when he is satisfied that such capacity will not thereby be exceeded.

It shall be the responsibility of the owner, agent, proprietor or occupant of Group F and G Occupancies, or any occupancy where excessive floor loading is likely to occur, to employ a competent architect or engineer in computing the safe load capacity. All such computations shall be accompanied by an affidavit from the architect or engineer stating the safe allowable floor load on each floor in pounds per sq. ft. uniformly distributed; it shall thereupon be filed as a permanent record of the department of building.

110.2 — SIGNS REQUIRED

In every building or part of a building used for business storage, industrial or hazardous purposes, the safe floor loads, as approved by the Building Official, shall be marked on plates of approved design which shall be supplied and securely affixed by the owner of the building in a conspicuous place in each story to which they relate. Such plates shall not be removed or defaced, and if lost, removed or defaced, shall be replaced by the owner of the building.

110.3 — LOADS IN EXCESS OF POSTED CAPACITY

No such owner shall place, or permit to be placed, on any floor of a building a greater load than the safe load so determined and posted.

SECTION 111—BOARD OF ADJUSTMENTS AND APPEALS

111.1 — APPOINTMENT

There is hereby established in the City a board to be called the Board of Adjustments and Appeals, which shall consist of five (5) members. Such Board shall be composed of one Architect, one General Contractor or Engineer and three Members at large from the

Building Industry. The said Board shall be appointed by the Chief Appointing Authority.

111.2 — TERM OF OFFICE

Of the members first appointed two shall be appointed for a term of one year, two for a term of two years, one for a term of three years, and thereafter they shall be appointed for terms of four years. Vacancies shall be filled for an unexpired term in the manner in which original appointments are required to be made. Continued absence of any member from regular meetings of the Board shall, at the discretion of the Chief Appointing Authority of the municipality, render any such member liable to immediate removal from office.

111.3 — QUORUM

Three members of the board shall constitute a quorum. In varying the application of any provisions of this code or in modifying an order of the Building Official, affirmative votes of the majority present, but not less than three affirmative votes shall be required. No board member shall act in a case in which he has a personal interest.

111.4 — RECORDS

The Building Official shall act as Secretary of the Board of Adjustments and Appeals and shall make a detailed record of all its proceedings, which shall set forth the reasons for its decisions, the vote of each member participating therein, the absence of a member, and any failure of a member to vote.

111.5 — PROCEDURE

The board shall establish rules and regulations for its own procedure not inconsistent with the provisions of this code. The board shall meet at regular intervals, to be determined by the Chairman, or in any event, the board shall meet within ten days after notice of appeal has been received.

SECTION 112—APPEALS

112.1 — TIME LIMIT

(a) Whenever the Building Official shall reject or refuse to approve the mode or manner of construction proposed to be followed, or materials to be used in the erection or alteration of a building or structure, or when it is claimed that the provisions of this code do not apply, or that an equally good or more desirable form of construction can be employed in any specific case, or when it is claimed that the true intent and meaning of this code or any of the regulations thereunder have been misconstrued or wrongly interpreted, the owner of such building or structure, or his duly authorized agent, may appeal from the decision of the Building Official to the Board

of Adjustments and Appeals. Notice of appeal shall be in writing and filed within 90 days after the decision is rendered by the Building Official. A fee of \$10.00 shall accompany such notice of appeal.

(b) In case of a building or structure which, in the opinion of the Building Official, is unsafe or dangerous, the Building Official may, in his order, limit the time for such appeal to a shorter period. Appeals hereunder shall be on forms provided by the Building Official.

SECTION 113—DECISIONS OF THE BOARD OF ADJUSTMENT AND APPEALS

113.1 — VARIATIONS AND MODIFICATIONS

(a) The Board of Adjustments and Appeals, when so appealed to and after a hearing, may vary the application of any provision of this code to any particular case when, in its opinion, the enforcement thereof would do manifest injustice, and would be contrary to the spirit and purpose of this code or public interest, or when, in its opinion the interpretation of the Building Official should be modified or reversed.

(b) A decision of the Board of Adjustments and Appeals to vary the application of any provision of this code or to modify an order of the Building Official shall specify in what manner such variation or modification is made, the conditions upon which it is made and the reasons therefor.

113.2 — DECISIONS

(a) Every decision of the Board of Adjustments and Appeals shall be final, subject, however, to such remedy as any aggrieved party might have at law or in equity. It shall be in writing and shall indicate the vote upon the decision. Every decision shall be promptly filed in the office of the Building Official, and shall be open to public inspection; a certified copy shall be sent by mail or otherwise to the appellant and a copy shall be kept publicly posted in the office of the Building Official for two weeks after filing.

(b) The Board of Adjustments and Appeals shall, in every case, reach a decision without unreasonable or unnecessary delay.

(c) If a decision of the Board of Adjustments and Appeals reverses or modifies a refusal, order, or disallowance of the Building Official, or varies the application of any provision of this code, the Building Official shall immediately take action in accordance with such decision.

SECTION 114—VIOLATIONS AND PENALTIES

Any person, firm, corporation or agent who shall violate a provision of this code or fail to comply therewith, or with any of the requirements thereof, or who shall erect, construct, alter, demolish

or move any structure, or has erected, constructed, altered, repaired, moved or demolished a building or structure in violation of a detailed statement or drawing submitted and approved thereunder, shall be guilty of a misdemeanor. Each such person shall be deemed guilty of a separate offense for each and every day or portion thereof during which any violation of any of the provisions of this code is committed, or continued and upon conviction of any such violation such person shall be punished within the limits and as provided by State Laws.

SECTION 115—VALIDITY

If any section, sub-section, sentence, clause or phrase of this Ordinance is for any reason held to be unconstitutional, such decision shall not affect the validity of the remaining portions of this Code.

(b) A decision of the Board of Adjustments and Appeals to vary the application of any provision of this code or to modify any order of the Building Official shall specify in what manner such variation or modification is made, the conditions upon which it is made and the reasons therefor.

113 — DECISIONS

(a) Every decision of the Board of Adjustments and Appeals shall be final, subject, however, to the remedy as and as provided in this code. Every decision of the Board of Adjustments and Appeals shall be promptly filed in the office of the Building Official and shall be open to public inspection; a certified copy shall be sent by mail or otherwise to the applicant and a copy shall be kept publicly posted in the office of the Building Official for two weeks after filing.

(b) The Board of Adjustments and Appeals shall, in every case, reach a decision without unnecessary or unnecessary delay.

(c) If a decision of the Board of Adjustments and Appeals reviews or modifies a refusal, order or disallowance of the Building Official or varies the application of any provision of this code, the Building Official shall immediately take action in accordance with such decision.

SECTION 116—VIOLATIONS AND PENALTIES

Any person who violates a provision of this code shall be liable to a fine of not more than \$100 and to imprisonment for not more than 30 days, or both, at the discretion of the court.

CHAPTER II—DEFINITIONS

SECTION 201—DEFINITIONS

201.1

For the purpose of this Code, certain abbreviations, terms, phrases, words, and their derivatives, shall be construed as set forth in this Section.

201.2

Words used in the present tense include the future. Words in the masculine gender include the feminine and neuter. Words in the feminine and neuter gender include the masculine. The singular number includes the plural and the plural number includes the singular.

ALLEY—means any public space or thoroughfare twenty (20) feet or less in width which has been dedicated or deeded for public use.

ALTER OR ALTERATION—means any change or modification in construction or occupancy.

AMUSEMENT DEVICE—means a mechanically operated device which is used to convey persons in any direction as a form of amusement.

APARTMENT—means a room or a suite of rooms occupied, or which is intended or designed to be occupied, as the home or residence of one individual, family or household, for housekeeping purposes.

APARTMENT HOUSE—means any building, or portion thereof, which is designed, built, rented, leased, let or hired out to be occupied, or which is occupied as the home or residence of more than two (2) families living independently of each other and doing their own cooking in the said building, and shall include flats and apartments.

APPROVED—Means approved by the Building Official.

ARCHITECT—within the meaning of this Code, shall be deemed to be a duly registered and licensed architect.

AREA—as applied to the dimensions of a building, means the maximum horizontal projected area of the building at grade.

AREA—(See FLOOR AREA).

A. S. A.—means American Standards Association.

A. S. T. M.—means American Society for Testing Materials.

ASSEMBLY OCCUPANCY—(Defined in Section 408.1).

ATTIC STORY—means any story situated wholly or partly in

the roof, so designated, arranged or built as to be used for business, storage or habitation.

AUTOMATIC—as applied to a fire door or other opening protective, means normally held in open position and automatically closed by a releasing device actuated by abnormal high temperature, or by a pre-determined rate of rise in temperature.

BALCONY—means that portion of the seating space of an assembly room, the lowest part of which is raised four (4) feet or more above level of the main floor.

BASEMENT—means that portion of a building between floor and ceiling, which is partly below and partly above grade (as defined in this Section), but so located that the vertical distance from grade to the floor below is less than the vertical distance from grade to ceiling, provided, however, that the distance from grade to ceiling shall be at least four (4) feet six (6) inches. (see STORY).

BEAM—a primary structural member supporting secondary structural members, floor, roof, joists, and the like.

BUILDING—means any structure built for the support, shelter, or enclosure of persons, animals, chattels, or property of any kind. The term "building" shall be construed as if followed by the words "or part thereof."

EXISTING BUILDING—means a building erected prior to the adoption of this Code, or one for which a legal building permit has been issued.

BUILDING LINE—means the line, established by law, beyond which a building shall not extend, except as specifically provided by law.

BUILDING OFFICIAL—means the officer, or other person, charged with the administration and enforcement of this ordinance, or his duly authorized representative.

BUSINESS OCCUPANCY—(Defined in Section 405.1).

CAST STONE—is a building stone manufactured from cement concrete precast and used as a trim, veneer or facing on or in buildings or structures.

CELLAR—means that portion of a building, the ceiling of which is entirely below grade or less than four (4) feet six (6) inches above grade. (See STORY.)

CITY—means the municipal corporation which has adopted this Code.

COMBUSTIBLE MATERIAL—means an inflammable material which will ignite at or below a temperature of 1200° F. and continue to burn or glow.

COMMON-PROPERTY LINE—means a line dividing one lot from another when said lots are not of one ownership.

CONCRETE—all definitions in Section 1601.4.

CURB LEVEL—referring to a building, means the elevation at that point of the street grade that is opposite the center of the wall nearest to and facing the street line.

DEAD LOAD—(See Section 1201.1).

DISPLAY SIGN—means a structure that is arranged, intended, designed or used as an advertisement announcement or direction; and includes a sign, sign screen, billboard and advertising devices of every kind.

DWELLING—when used in this Code without other qualifications, means a structure occupied exclusively for residential purpose by not more than two families.

ENGINEER—within the meaning of this Code, shall be deemed to be a duly registered and licensed engineer.

EXISTING BUILDING—(See **BUILDING—EXISTING BUILDING**).

FAMILY—means one or more persons living together, whether related to each other by birth or not, and having common house-keeping facilities.

FILLING STATION—(Defined in Section 505).

FIRE DOOR—means a door and its assembly, so constructed and assembled in place as to give the specified protection against the passage of fire.

FIRE LIMITS—(See Section 301).

FIRE PARTITION—means a partition of construction which subdivides a building to restrict the spread of fire or to provide areas of refuge, but is not necessarily continuous through all stories nor extended through the roof, and which has a fire-resistance rating as required by the Code.

FIREPROOF CONSTRUCTION—(Defined in Section 602).

FIRE-RESISTANCE RATING—means the time in hours that the material or construction will withstand the standard fire exposure as determined by a fire test made in conformity with the "Standard Methods of Fire Tests of Building Construction and Materials" of the American Society for Testing Materials (ASTM Designation E119-47).

FIRE-RESISTIVE CONSTRUCTION—(Defined in Section 603).

FIRE WALL—(See Walls).

FLOOR AREA—means the area included within surrounding walls of a building exclusive of vent shafts and courts.

FRONT OF LOT—means the front boundary line of a lot bordering on the street, and in the case of a corner lot, may be either frontage.

GALLERY—means that portion of the seating space of an assembly room having a seating capacity of more than ten (10) located above a balcony.

GARAGE—

PRIVATE GARAGE—(Defined in Section 506).

PUBLIC GARAGE—means any garage other than a private garage.

GRADE—with reference to a building, means, when the curb level has been established, the main elevation of the curb level opposite those walls that are located on, or parallel with and within fifteen (15) feet of, street lines; or, when the curb level has not been established, or all the walls of the building are more than fifteen (15) feet from street lines, **GRADE** means the average of the finished ground level at the center of all walls of a building.

GRADE—with reference to lumber, means the division of sawn lumber into quality classes with respect to its physical and mechanical properties as defined in published lumber manufacturers' standard grading rules.

HABITABLE ROOM—means a room occupied by one or more persons for living, eating, sleeping, or working purposes. It does not include toilets, laundries, serving and storage pantries, corridors, cellars, and spaces that are not used frequently or during extended periods.

HEATING—(All definitions in Chapter VIII).

HEAVY TIMBER CONSTRUCTION—(Defined in Section 604).

HEIGHT—as applied to a building, means the vertical distance from grade to the highest finished roof surface in the case of flat roofs or to a point at the average height of roofs having a pitch of more than one (1) foot in four and one-half ($4\frac{1}{2}$) feet; **HEIGHT** of a building in stories does not include basements and cellars, except as specifically provided otherwise.

HEIGHT—as applied to a story, means the vertical distance from top to top of two successive finished floor surfaces.

HEIGHT—as applied to a wall, means the vertical distance to the top measured from the foundation wall, or from a girder or other immediate support of such wall.

INCOMBUSTIBLE MATERIAL—is synonymous with **NON-COMBUSTIBLE MATERIAL**.

INDUSTRIAL OCCUPANCY—(Defined in Section 308.1).

INNER COURT—an open unoccupied space bounded by the walls of the building, but located within the exterior walls of the building.

INSTITUTIONAL OCCUPANCY—(Defined in Section 407.1).

LINTEL—means the beam or girder placed over an opening in

a wall which supports the wall construction above.

LIVE LOAD—(See Section 1203).

MASONRY—means that form of construction, composed of stone, brick, concrete, gypsum, hollow clay tile, concrete block or tile, or other similar building units or materials or a combination of these materials laid up unit by unit and set in mortar. For the purpose of this Code, plain monolithic concrete shall be considered as Masonry. (See Section 1402.6).

SOLID MASONRY—means masonry built without hollow spaces.

MEZZANINE OR MEZZANINE FLOOR—means an intermediate floor placed in any story or room. When the total area of any "MEZZANINE FLOOR" exceeds thirty three and one-third (33 1/3) percent of the total floor area in that room, it shall be considered as constituting an additional "story." The floor height above or below a "MEZZANINE FLOOR" construction shall be not less than seven (7) feet.

MIXED TYPES OF CONSTRUCTION—has the meaning as set forth in Section 609 of this Code.

MULTIPLE DWELLING—has the same meaning as APARTMENT HOUSE.

NON-COMBUSTIBLE MATERIAL—means a non-inflammable material which will not ignite at or below a temperature of 1200° F. and will not continue to burn or glow at that temperature.

NON-COMBUSTIBLE CONSTRUCTION—(Defined in Section 605.1).

OCCUPANCY—means the purpose for which a building is used or intended to be used. Change of occupancy is not intended to include change of tenants or proprietors.

MIXED OCCUPANCY—means mixed occupancy as set forth in Section 412 of this Code.

SPECIAL OCCUPANCY—means Group H Occupancy, as set forth in Section 411 of this Code.

ORDINARY CONSTRUCTION—(Defined in Section 606).

OWNER—includes his duly authorized agent or attorney, a purchaser, devisee, fiduciary, and a person having a vested or contingent interest in the property in question.

PASSAGEWAY—means an enclosed hallway or corridor connecting a required exit to a street.

PENTHOUSE—means an enclosed structure other than a roof structure, located on the roof, extending not more than twelve (12) feet above a roof.

PERSON—means a natural person, his heirs, executors, administrators, or assigns, and also includes a firm, partnership, or corporation, its or their successors or assigns, or the agent of any of the aforesaid.

PUBLIC PLACE—as used in this Code, means an unoccupied open space adjoining a building and on the same property, that is permanently maintained accessible to the Fire Department and free of all incumbrances that might interfere with its use by the Fire Department.

REPAIR—means the replacement of existing work with the same kind of material used in the existing work, not including additional work that would change the structural safety of the building, or that would affect or change required exit facilities, a vital element of an elevator, plumbing, gas piping, wiring or heating installation, or that would be in violation of a provision of law or ordinance. The term "Repair" or "Repairs" shall not apply to any change of construction.

REQUIRED—means required by some provision of this Code.

RESIDENTIAL OCCUPANCY—(Defined in Section 404.1).

ROOF STRUCTURE—means a structure above a roof or any part of a building enclosing a stairway, tank, elevator machinery or ventilating apparatus, or such part of a shaft as extends above the roof.

ROOM CAPACITY—(See Section 1105.1).

SCHOOL OCCUPANCY—(Defined in Section 406.1).

SEATING CAPACITY—(See Section 408.3).

SELF-CLOSING—as applied to a fire door or other opening protective, means normally closed and equipped with an approved device which will insure closing after having been opened for use.

SHAFT—means a vertical opening extending through one or more stories of a building, for elevators, dumbwaiter, light, ventilation, or similar purpose.

SHALL—as used in this Code, is mandatory.

SIGNS—(See Chapter XXIII).

SPECIAL OCCUPANCY—(Defined in Section 411.1).

SPRINKLERED—means equipped with an approved automatic sprinkler system properly maintained.

STAIRWAY—means one or more flights of stairs and the necessary landings and platforms connecting them, to form a continuous and uninterrupted passage from one story to another in a building or structure.

STANDARD FIRE TEST—means the fire test formulated under the procedure of the American Standards Association as "American Standard." This "American Standard" is the "Standard Methods of Fire Tests of Building Construction and Materials" of the American Society for Testing Materials (ASTM Designation E119-47).

STORY—means that portion of a building included between the upper surface of any floor and the upper surface of the floor next above, except that the topmost story shall be that portion of a

building included between the upper surface of the topmost floor and the ceiling or roof above. (For basement of schools see Section 402.5).

STREET—means any public thoroughfare (street, avenue, boulevard, park) or space more than twenty (20) feet in width which has been dedicated or deeded to the public for public use.

STREET LINE—means a lot line dividing a lot from a street.

STRUCTURE—means that which is built or constructed, an edifice or building of any kind, or any piece of work artificially built up or composed of parts joined together in some definite manner. The term "structure" shall be construed as if followed by the words "or part thereof."

SURVEYOR—within the meaning of this Code, shall be deemed to be a duly registered and licensed surveyor or Civil Engineer.

THEATER—means a building, or part thereof, which contains an assembly hall with or without stage which may be equipped with curtains and permanent stage scenery or mechanical equipment adaptable to the showing of plays, operas, motion pictures, performances, spectacles and similar forms of entertainment. (See Section 408.)

VALUATION OR VALUE—as applied to a building, means the estimated cost to replace the building in kind.

VENEER—means a facing of brick, concrete, metal, stone, tile or similar material attached to a wall for the purpose of providing ornamentation, protection, or insulation, but not counted as adding strength to the wall.

WALLS—

BEARING WALLS—means a wall which supports any vertical load in addition to its own weight.

CAVITY WALL—means a wall built of masonry units or of plain concrete, or a combination of these materials, so arranged as to provide an air space within the wall, and in which the inner and outer parts of the wall are tied together with metal ties.

CURTAIN WALL—means a non-bearing wall between columns or piers and which is not supported by girders or beams, but is supported on the ground.

FACED WALL—means a wall in which the masonry facing and backing are so bonded as to exert common action under load.

FIRE PARTITION—(See definition under "F".)

FIRE WALL—means a wall of incombustible construction which subdivides a building or separates buildings to restrict the spread of fire and which starts at the foundation and extends continuously through all stories to and above the roof, except where the roof is of fireproof or fire-resistive construction and the wall is carried up tightly against the underside of the roof slab.

FOUNDATION WALL—means a wall below the first floor extending below the adjacent ground level and serving as support for a wall, pier, column or other structural part of a building.

HOLLOW WALL OF MASONRY—means a wall built of masonry units so arranged as to provide an air space within the wall, and in which the inner and outer parts of the wall are bonded together with masonry units or steel.

NON-BEARING WALL—means a wall which supports no load other than its own weight.

PANEL WALL—means a non-bearing wall in skeleton or framed construction, built between columns or piers and wholly supported at each story.

PARAPET WALL—means that part of any wall entirely above the roof line.

PARTY WALL—means a wall used or adapted for joint service between two (2) buildings.

RETAINING WALL—means any wall used to resist the lateral displacement of any material.

WOOD FRAME CONSTRUCTION—(Defined in Section 607).

WRITING—includes printing and typewriting.

WRITTEN NOTICE—shall be considered to have been served if delivered in person to the individual, or to the parties intended, or if delivered at, or sent by registered mail to, the last business address to the party giving the notice.

CHAPTER III FIRE DISTRICTS

SECTION 301—GENERAL BUILDING RESTRICTIONS— WITHIN FIRE DISTRICTS

301.1 — GENERAL

For the purpose of this Code there shall be established two fire districts or zones, which shall be known as the first and second Fire Districts.

301.2. TYPES OF CONSTRUCTION PERMITTED

Within the first and second fire districts every building hereafter erected shall be one of the following types except temporary structures as provided in Sect. 504 and one and two family dwellings which may be erected of type VI wood frame construction in the second fire district only:

- Type I—Fireproof
- Type II—Fire-Resistive.
- Type III—Heavy Timber.
- Type IV—Non-Combustible Frame.
- Type V—Ordinary.

301.3. OTHER SPECIFIC REQUIREMENTS

(a) Exterior Walls

Exterior walls of buildings located in the First Fire District, shall be of fire-resistive construction, as specified for the various types of construction in Chapter VI, but in no case shall exterior walls facing and located within 30 feet of property lines, have less than 2 hour fire-resistance against outside fire exposure, except as provided in Chapter VI.

(b) Group "H" Special Hazardous Not Permitted

Every Group "H" occupancy shall be prohibited from location within the First Fire District.

(c) Fire Protection

Every building shall be fire protected throughout as specified for the various types of construction, Chapter VI.

(d) Roof Coverings

Roof coverings in the fire districts shall conform to the requirements for class 1 or 2 roof coverings, as defined in section 706, page 109 of this code.

(e) Interior Fire Protection-First Fire District

Floors over usable spaces, all walls and partitions, except those of a temporary nature within a tenancy, shall be of not less than 1-hour fire-resistive construction. (Temporary partitions are defined under Group B-Business Building in Section 702.2).

301.5 — SCOPE

Each Fire District shall include such territory or portion of the city as outlined in an ordinance of said city entitled, "An Ordinance Creating and Establishing Fire Districts." Whenever, in such ordinance creating and establishing Fire Districts, reference is made to any Fire District, it shall be construed to mean one of the Fire Districts designated and referred to in this Chapter.

SECTION 302—CHANGES TO BUILDINGS

302.1 — EXISTING BUILDINGS

Within the First and Second Fire Districts no existing building shall be hereafter increased in height unless it is of a type of construction permitted for new buildings within such Fire Districts, or is altered to comply with the requirements for such type of construction; nor shall any existing building be hereafter extended on any side, unless such extensions are of a type of construction permitted for new buildings within such Fire Districts.

302.2 — ALTERATIONS — GENERAL

Nothing in this section, however, shall prohibit other alterations within the Fire Districts, provided there is no change of occupancy that is otherwise prohibited and provided the fire hazard is not increased by such alterations.

302.3 — MOVING BUILDINGS

No building shall hereafter be moved from one Fire District into another or to another lot in the same District unless its type of construction is permitted in the District into, or within, which it is to be moved. (See Section 2204 — Regulations for Moving Buildings).

SECTION 303—BUILDINGS LOCATED IN TWO DISTRICTS

Any building located in more than one Fire District shall be of a type of construction required for the most highly restricted District unless the major part of such building lies outside of such District, and no part is more than ten (10) feet inside the boundaries of such district.

SECTION 304—EXCEPTIONS TO RESTRICTIONS IN FIRE DISTRICTS

304.1 — FIRST FIRE DISTRICT

The preceding provisions of this chapter shall not apply to

temporary buildings used in connection with duly authorized construction, nor to water tanks or cooling towers conforming to Sections 713 and 714, nor to display signs conforming to Chapter XXIII.

304.2 — SECOND FIRE DISTRICT

The exceptions in the Second Fire District shall be as follows:

1. A private garage used exclusively as such, not more than one story in height, nor more than six hundred and fifty (650) sq. ft. in area located on the same lot with a dwelling.
2. Fences not over eight (8) feet in height.
3. Coal tipples, material bins, trestles conforming to Section 503.
4. Water tanks and cooling towers conforming to Sections 713 and 714.
5. Greenhouses less than fifteen (15) feet high.
6. Porches on dwellings, not over one story in height and not over ten (10) feet wide from the face of the building, provided such porch does not come within 5 feet of any property line.
7. Display signs as provided in Chapter XXIII.
8. Sheds, open on a long side, not over 15 feet high or 500 square feet in area.

304.3 — OUTSIDE OF FIRE DISTRICTS

Outside the First and Second Fire Districts all types of construction are permitted provided they comply with the provisions prescribed elsewhere in this code that apply regardless of location. Roof coverings shall conform to the requirements as defined in Section 706.

SECTION 403—EXCEPTIONS TO AREA RESTRICTIONS

403.1 — GENERAL

The exceptions and conditions in this Section shall modify the area limits of this Chapter as provided.

403.2 — AREA INCREASES NOT PERMITTED (WITH EXCEPTION)

The increase of floor areas permitted by this Section may be used as guidelines to determine whether a building is to be classified as a Group A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z, or as a miscellaneous building. The classification of a building is determined by the classification of the building's use. The classification of a building is determined by the classification of the building's use. The classification of a building is determined by the classification of the building's use.

CHAPTER IV

CLASSIFICATION OF BUILDING

BY OCCUPANCY

SECTION 401—CLASSIFICATION BY OCCUPANCY OR USE

401.1 — GENERAL

Every new and existing building, or part thereof, shall, for the purpose of this Code, be classified according to its use or occupancy as a building of one of the following OCCUPANCY GROUPS:

GROUP A—RESIDENTIAL

GROUP B—BUSINESS

GROUP C—SCHOOL

GROUP D—INSTITUTIONAL

GROUP E—ASSEMBLY

GROUP F—STORAGE

GROUP G—INDUSTRIAL

GROUP H—HAZARDOUS

Each occupancy group is intended to embrace buildings as hereinafter defined and those of similar character or use. Wherever there is any uncertainty as to the classification of a building, the Building Official shall fix the classification within which it falls, according to the relative fire hazard involved.

SECTION 402—HEIGHT AND AREA RESTRICTIONS

402.1 — APPLICATION

In the protection of each occupancy, the maximum height and area for buildings of the different types of construction, shall be governed by the intended use of the buildings, or occupancy, as provided for in this Chapter.

402.2 — DEFINITIONS

For the purpose of this Code, "height" and "area," as applied to a building, has the meaning designated in Chapter II, Definitions.

402.3 — EXCEPTIONS — HEIGHT

Church spires, chimneys, tanks and supports, aerial supports, parapet walls not over four (4) feet high, bulkheads and penthouses used solely to enclose stairways, tanks, elevator machinery or shafts, or ventilation or air-conditioning apparatus, need not be considered in determining the highest point of the building; provided that the highest point shall be taken to be the highest point of the roof of the highest penthouse when the aggregate area of all penthouses and other roof structures exceeds twenty (20) percent of the area of the roof upon which they stand. (See requirements of Sections 712 and 713).

402.4 — MEZZANINES

Mezzanine floors or galleries shall not be regarded as a story unless they exceed thirty-three and one-third ($33\frac{1}{3}$) percent of the aggregate ground floor area.

402.5 — LIMITATIONS, HEIGHT

(a) The basement or cellar of a building shall not count as a story if the first floor above such basement or cellar is less than seven (7) feet above grade, except that in school buildings of Group C, where the basement is used or usable for any purpose other than heating, such basement is counted as a story.

SECTION 403—EXCEPTIONS TO AREA RESTRICTIONS

403.1 — GENERAL

The exceptions and requirements of this Section shall modify the area limits of this Chapter, as herein provided.

403.2 — AREA INCREASES NOT PERMITTED (WITH EXCEPTION)

The increase of floor areas permitted by this Section may be additive when applicable, except that in buildings where, because of occupancy, type construction or fire districts, one-hour fire-resistive construction is a requirement, or automatic sprinkler equipment is required, as specified in Section 901, no increase of area shall be permitted because of such construction or equipment.

403.3 — EXCEPTIONS — AREA — FIRE DIVISION WALLS

(a) General

For the purpose of this Code, each part of a building included within fire walls shall be deemed to be a separate building.

(b) New Buildings

No building shall be limited in area when divided into sections by fire walls having not less than four hour fire-resistive ratings, as specified in Chapter VI, provided no section exceeds the maximum allowable floor area in this Chapter.

(c) Existing Buildings

No building hereafter erected shall be extended to exceed the maximum floor area set forth in this chapter, governed by the occupancy and type of construction. However, a building heretofore lawfully erected, which already exceeds such maximum area, may be extended, provided such extension does not exceed the maximum area prescribed and provided such extension is separated from the existing building by a fire wall having a fire-resistive rating of not less than four hours.

403.4 — AREA INCREASE FOR ONE-HOUR FIRE RESISTANCE

Buildings of Type IV, Non-combustible Frame, and Type V, Ordinary Construction, the interiors, of which are provided throughout with not less than one-hour fire-resistive construction may have the maximum allowable areas of this Chapter increased fifty (50) percent, if of Type IV construction and 33 1/3 percent if of Type V construction, except in buildings where occupancy or conditions are such that one-hour fire resistance is a requirement of this Code.

403.5 — AREA INCREASE FOR SEPARATION ON TWO OR MORE SIDES OF A BUILDING

Where streets or public places, of minimum width not less than 20 feet, extend along two or more sides of a building of Group B, Business; Group F, Storage or Group G, Industrial Occupancy, the maximum areas specified in this chapter and modified as provided in this Section; such buildings may be increased by the percentage specified in Table 403.5 for each foot by which the minimum width of such streets or public places exceeds 20 feet, but such increase shall not exceed the maximum percentage shown in Table 403.5.

TABLE 403.5 — RATE OF AREA INCREASE FOR SEPARATION

	Rate for Areas Increase for Separation Over 20' Wide	Max. Area Increase
Separation along 2 sides but along not less than 50% of perimeter of building	1% per Ft. over 20 Ft.	50%
Separation along 3 sides but along not less than 75% of perimeter of building	2% per Ft. over 20 Ft.	100%

Separation along all sides
or along 100% of peri-
meter of building

3% per Ft. over 20 Ft. 100%

403.6 — AREA INCREASE FOR SPRINKLERS

The maximum allowable floor areas specified in this Chapter and modified as provided in this Section, may be doubled if the building is provided with approved automatic sprinklers throughout in accordance with Section 901 of Chapter IX, except that such increase shall not be permitted in buildings where conditions are such that sprinkler equipment is a requirement of this Code or, except that such increase in area shall not be permitted in buildings of such height that the installation of approved automatic sprinkler equipment is a mandatory requirement of this Code under the regulations prescribed in Section 404 to Section 411 herein, or, where in the opinion of the Building Official, for the nature of the hazard involved is such that sprinkler equipment does not reduce the fire hazard sufficiently to warrant such increase of area.

403.7 — UNLIMITED AREAS

The area of a one-story building of Group B, Business, Group F, Storage, or of Group G, Industrial Occupancy, located outside of the First and Second Fire Districts, shall not be limited provided the building is equipped with approved automatic sprinklers, or other approved fire-protective systems, throughout, in accordance with Section 901 and is surrounded on all sides by streets or public places of width not less than specified in Table 403.7.

Table 403.7—Width of separation for unlimited Area.

	Minimum Width of Separation
Type II,—Fire-Resistive Construction	60 feet
Type III,—Heavy Timber Construction	80 feet
Type IV—Non-Combustible Frame Construction	100 feet
Type V—Ordinary Construction	100 feet
Type VI—Wood Frame Construction	150 feet

SECTION 404—GROUP "A"—RESIDENTIAL

404.1 — SCOPE

Buildings in which families or households live or in which sleeping accommodations are provided, and all dormitories, shall be classified as Group A—Residential Occupancy. Group A—Residential Occupancy—shall include, among others, the following:

Dwellings

Multiple Dwellings (more than two families)

Hotels

Dormitories

Lodging Houses

Convents

Monasteries

404.2 — PROTECTIVE REQUIREMENTS — GROUP "A" OCCUPANCY

SECTION

- | | |
|---|-------------------------|
| 1. Allowable Height and Area | 404.4 |
| 2. Type of Construction | 601 to 609, inclusive |
| 3. Exit Requirements | 1101 to 1120, inclusive |
| 4. Protection of Vertical Openings | 701 to 701.4, inclusive |
| 5. Protection of Wall Openings | 703 to 703.7, inclusive |
| 6. Sprinklers and Standpipes Required | 901 to 902, inclusive |
| 7. Mixed Occupancy Separations | 412 |
| 8. Light, Ventilation and Sanitation | 2001 to 2002, inclusive |
| 9. Heating Requirements | Chapter VIII |

404.3 — SPECIAL REQUIREMENTS, GROUP "A" OCCUPANCY

- | | |
|--|---------------|
| 1. Separation of Furnace or Boiler Rooms | Section 801.2 |
| 2. Storage and handling of flammable liquids shall be prohibited in every Group "A" Occupancy. Not more than one (1) gallon of flammable liquid, used for cleaning purposes only, may be kept in a residence, provided such flammable liquid is kept in an approved container, used especially for that purpose. | |
| 3. Gas Feed Lines | Section 809 |

404.4. GROUP "A" RESIDENTIAL OCCUPANCY—HEIGHT AND AREA RESTRICTIONS

ALLOWABLE HEIGHTS		ALLOWABLE AREAS		
Type Construction Used		Area Per Floor (sq. ft.)		
	Story Height	One Story	Two Stories	Over Two Stories
Type I—Fireproof	No Limit	No Limit	No Limit	No Limit
Type II—Fire-Resistive	80 ft. (a)	No Limit	No Limit	No Limit
Type III—Heavy Timber	Three	10,000	8,000	6,500
Type IV—Non-Combustible	Five*	11,000	9,000	6,500
Type V—Ordinary	Five*	10,000	8,000	6,400
Type VI—Wood Frame	Two & one-half	6,000	5,000	4,000**

*When over 4 stories in height, two-hour fire resistive floors shall be required over basement or cellar.

**For one and two-family dwellings only.

(a) The height of Type II Fire-Resistive construction for buildings of Group "A" Residential Occupancies, shall not be limited provided the fire-resistance of all columns shall be not less than 3 hours, and of the other structural members, including floors, shall be not less than that shown in Table 603.5 but in no case less than 2 hours, except that roofs shall be at not less than 1½-hour fire resistive construction.

SECTION 405—GROUP "B"—BUSINESS

405.1 — SCOPE

Buildings which are occupied for business or rendering of professional services shall be classified in Group B-1; buildings which are occupied for the sale or display of merchandise, or the supplying of food or drink, shall be classified in Group B-2.

Group B—Business Occupancy includes, among others, the occupancies listed below, but does not include buildings used for any purpose involving highly combustible, inflammable or explosive materials.

Group B-1—Office buildings, green houses, filling stations, banks, undertaking parlors, temporary structures.

Group B-2—Stores, shops, markets, restaurants (See exception in Section 405.2).

405.2 — EXCEPTION

Restaurants or places supplying food or drink that accommodate 75 or more people, or that have a stage, or that provide dancing or entertainment features, shall be classified in Group E — Assembly and not in Group B — Business Occupancy (See Section 408).

405.3 — PROTECTIVE REQUIREMENTS—GROUP "B" OCCUPANCY SECTION

1. Allowable Height and Area	405.5
Heights and Areas are based upon type of construction used.	
2. Type of Construction	601 to 609, inclusive
3. Exit Requirements	1101 to 1120, inclusive
4. Protection of Vertical Openings	701 to 701.4, inclusive
5. Protection of Wall Openings	703 to 703.7, inclusive
6. Sprinklers and Standpipes Required	901 to 902, inclusive
7. Mixed Occupancy Separations	412
8. Light, Ventilation and Sanitation	2001 to 2002, inclusive
9. Heating Requirements	Chapter VIII

405.4 — SPECIAL REQUIREMENTS—GROUP "B" OCCUPANCY SECTION

1. Separation of Boiler or Furnace Rooms	801.2
2. Special Exit Doorway Requirements	1110
3. Temporary Structures	504
4. Filling Stations	505
5. Greenhouses	509
6. Ratproof Construction Requirements	Chapter XIX
7. Storage and handling of flammable liquids is prohibited in buildings of Group "B" Occupancy, except filling stations, which shall conform to Section 501.1 (f).	

405.5—GROUP "B" BUSINESS OCCUPANCY—HEIGHT AND AREA RESTRICTIONS

	ALLOWABLE HEIGHTS		ALLOWABLE AREAS		
	Type Construction	Story Height	One Story	Two Story	Over Two Stories
Type I—Fire Proof		No limit	No limit	No limit	No limit
Type II—Fire Resistive		80 ft. (a)	No limit	No limit	No limit
Type III—Heavy Timber					
B-1—Offices, etc.	Five		17,000	13,500	9,000
B-2—Mercantile	Five		10,000	8,000	5,000
Type IV—Non-combustible*					
B-1—Offices, etc.	Five		14,000	10,000	6,000
B-2—Mercantile	Five		7,500	6,000	4,000
Type V—Ordinary*					
B-1—Offices, etc.	Five		11,500	9,200	6,000
B-2—Mercantile	Five		7,500	6,000	4,000
Type VI—Wood Frame					
B-1—Offices, etc.	Two		7,500	5,000	Not Permitted
B-2—Mercantile	Two		5,000	4,000	Not Permitted

*When more than four stories in height two-hour fire resistive floors shall be constructed over basement or cellar.

Note: For allowable increase in areas for additional protection, see Section 403.

(a) The height of Type II Fire-Resistive construction for buildings of Group "B" Business Occupancies, shall not be limited provided the fire-resistance of all columns shall be not less than 3 hours, and of the other structural members, including floors, shall be not less than that shown in Table 603.5, but in no case less than 2 hours, except that roofs shall be of not less than 1½-hour fire-resistive construction.

SECTION 406—GROUP "C"—SCHOOLS

406.1 — SCOPE

Buildings in which people come together for education or instructional purposes shall be classified in Group "C" — School Occupancy.

Group C — School Occupancy shall include, among others, the following:

Schools

Universities

Colleges

Academies

406.2 — EXCEPTION

Parts of buildings used for the congregating or gathering of 75 or more persons in one room shall be classified as in Group E — Assembly Occupancy—(see Section 408), regardless of whether such gathering is of an educational or instructional nature or not.

Schools for business or vocational training shall be classified in the same occupancies and conform to the same requirements as the trade, vocation or business taught.

406.3 — PROTECTIVE REQUIREMENTS, GROUP "C" OCCUPANCY SECTION

1. Allowable Height and Area	406.5
Heights and Areas are based upon type of construction used.	
2. Types of Construction	601 to 609, inclusive
3. Exit Requirements	1101 to 1120, inclusive
4. Protection of Vertical Openings	701 to 701.4, inclusive
5. Protection of Wall Openings	703 to 703.7, inclusive
6. Sprinklers and Standpipes Required	901 to 902, inclusive
7. Mixed Occupancy Separations	412
8. Light, Ventilation and Sanitation	2001 to 2002, inclusive
9. Heating Requirements	Chapter VIII

406.4 — SPECIAL REQUIREMENTS, GROUP "C" OCCUPANCY SECTION

1. Separation of Boiler or Furnace Rooms	801.2
2. Non-combustible Stairways Required	1108
3. Corridors	1111
4. Not less than Unilateral Light shall be required	2001.5
5. No classroom shall occupy basement room fifty (50) percent below ground level.	
6. Every heating appliance which produces an unprotected open flame shall be prohibited.	
7. Gas Feed Lines, Protection Required	809
8. Storage and handling of flammable liquids shall be prohibited.	
9. Where permanent motion picture projectors are used, booths shall be provided, as set forth in Section 512.25.	
10. Small children shall be on first floor.	

In buildings of other than Type I and II construction, children below the fifth grade shall not occupy any classroom above the first floor. The lower grades shall be located in the classrooms nearest the exits.

406.5. GROUP "C" SCHOOL OCCUPANCY—HEIGHT AND AREA RESTRICTIONS

ALLOWABLE HEIGHTS		ALLOWABLE AREAS		
Type Construction Used**	Story Height	Area Per Floor (sq. ft.)		
		One Story	Two Stories	Over Two Stories
Type I—Fireproof	No Limit	No Limit	No Limit	No Limit
Type II—Fire-Resistive	80 ft.	No Limit	No Limit	No Limit
Type III—Heavy Timber*	Two	10,000	8,000	Not Permitted
Type IV—Non-Combustible*	Two	10,000	8,000	Not Permitted
Type V—Ordinary*	Two	10,000	8,000	Not Permitted
Type VI—Wood Frame*	Two	6,500	5,000	Not Permitted

*Basement shall count as story if used for any other purpose other than heating. (See Section 402.5.)

**At least one-hour interior fire-resistive construction shall be used throughout in all Group "C" (schools), two or more stories in height.

SECTION 407—GROUP "D"—INSTITUTIONAL

407.1 — SCOPE

Buildings in which more than six people are detained for penal or correctional purposes; or in which the liberty of the inmates is restricted, or places of involuntary detention, shall be classified in Group D-1.

Buildings in which more than ten people are harbored for medical, charitable or other care or treatment shall be classified in Group D-2.

Group D-1 — Institutional Occupancy — shall include, among others, the following:

Insane Asylums

Reformatories

Jails

Prisons

Group D-2 — Institutional Occupancy — shall include, among others, the following:

Hospitals

Sanitariums

Orphanages

Old Peoples Homes

407.2 — EXCEPTION

Dormitories for doctors, nurses, and able-bodied help (not for patients or inmates) of Institutional buildings shall be classified as Group A — Residential Occupancy.

407.3 — PROTECTIVE REQUIREMENTS — GROUP "D" OCCUPANCY

SECTION

- | | |
|---|-------------------------|
| 1. Allowable Height and Area | 407.5 |
| Heights and Areas are based upon type of construction used. | |
| 2. Types of Construction | 601 to 609, inclusive |
| 3. Exit Requirements | 1101 to 1120 inclusive |
| 4. Protection of Vertical Openings | 701 to 701.4, inclusive |
| 5. Protection of Wall Openings | 703 to 703.7, inclusive |
| 6. Sprinklers and Standpipes Required | 901 to 902, inclusive |
| 7. Mixed Occupancy Separations | 412 |
| 8. Light, Ventilation and Sanitation | 2001 to 2002, inclusive |
| 9. Heating Requirements | Chapter VIII |

407.4 — SPECIAL REQUIREMENTS—GROUP "D" OCCUPANCY

	SECTION
1. Separation of Boiler or Furnace Room	801.2
2. Special Exit Doorway Requirements	1110
3. Special Exit Requirements for Sanitoriums	1104
4. Non-combustible Stairways Required	1108
5. Gas Feed Lines, Protection Required	809
6. Handlings and Storage of Combustible Film	501.3
7. Storage and Handling of Flammable Liquids shall be prohibited.	

SUB-CLASSIFICATIONS

Group D shall be divided into two sub-classifications as set forth in this Section, both of which shall comply with the requirements of Group D occupancy unless otherwise specified.

Group D-1 shall include theaters and places of assembly having a capacity of 500 or more people, also Group D-1 shall include theaters or places of assembly having no scenery loft or a depth of more than fifteen (15) feet, but having a capacity of 500 or more people.

Group D-2 shall include theaters and places of assembly having a capacity of 75 or more persons but having a capacity less than designated for Group D-1.

Group D-3 shall include theaters and places of assembly having a capacity of 75 or more persons but having a capacity less than designated for Group D-1.

Group D-4 shall include theaters and places of assembly having a capacity of 75 or more persons but having a capacity less than designated for Group D-1.

Group D-5 shall include theaters and places of assembly having a capacity of 75 or more persons but having a capacity less than designated for Group D-1.

Group D-6 shall include theaters and places of assembly having a capacity of 75 or more persons but having a capacity less than designated for Group D-1.

Group D-7 shall include theaters and places of assembly having a capacity of 75 or more persons but having a capacity less than designated for Group D-1.

Group D-8 shall include theaters and places of assembly having a capacity of 75 or more persons but having a capacity less than designated for Group D-1.

407.5. GROUP "D" INSTITUTIONAL OCCUPANCY—HEIGHT AND AREA RESTRICTIONS

ALLOWABLE HEIGHTS Type Construction Used*	ALLOWABLE AREAS Area Per Floor (sq. ft.)		
Story Height	One Story	Two Stories	Over Two Stories
Type I—Fireproof	No Limit	No Limit	No Limit
Type II—Fire-Resistive	No Limit	No Limit	No Limit
Type III—Heavy Timber			
Group D-1			
Group D-2			
Type IV—Non-Combustible			
Group D-1			
Group D-2			
Type V—Ordinary			
Group D-1			
Group D-2			
Type VI—Wood Frame			
Group D-1			
Group D-2			

* At least one-hour fire-resistive construction shall be provided throughout all buildings.

SECTION 408—GROUP "E"—ASSEMBLY

408.1 — SCOPE

Buildings in which provision is made for the congregation or gathering of seventy-five (75) or more persons in one room or space shall be classified in Group E — Assembly Occupancy. Such room or space shall include any occupied connecting room or space in the same story, or in a story or stories above or below, where entrance is common to the rooms or spaces. This occupancy includes buildings having an auditorium and a stage provided for the use of movable scenery, or having an auditorium for viewing motion pictures or for theatrical purposes.

Group E — Assembly Occupancy shall include, among others, the following:

Passenger Depots	Motion Picture Houses
Libraries	Public Assembly Halls
Stadiums and Grandstands	Churches
Restaurants (large)	Museums
Amusement Park Buildings	Auditoriums
Tents (Assembly)	Dance Halls
Bowling Alleys	Recreation Halls
Theaters	Gymnasiums

408.2 — SUB-CLASSIFICATIONS

Group E shall be divided into two sub-classifications as set forth in this Section, both of which shall comply with the requirements for Group E Occupancy unless otherwise specified:

(a) Group E-1 — Large Assembly

Group E-1 shall include theaters and places of public assemblies having a scenery loft and a stage with a depth of more than fifteen (15) feet upon which scenery may be installed, and having a capacity of 500 or more people; also Group E-1 shall include theaters or places of assembly having no scenery loft or stage with a depth of more than fifteen (15) feet, but having a capacity of 700 or more people.

(b) Group E-2 — Small Assembly

Group E-2 shall include theaters and places of assembly having a capacity of 75 or more persons but having a capacity less than designated for Group E-1.

408.3 — METHOD OF DETERMINING CAPACITY

The capacity or occupant content of theaters and places of assembly shall be determined according to the actual number of persons that will occupy the space. In computing the occupancy capacity, the capacity shall not be less than six (6) square feet of floor area per person with fixed seats, or fifteen (15) square feet of floor area per person where fixed seats are not provided.

408.4 — PROTECTIVE REQUIREMENTS — GROUP "E" OCCUPANCY

SECTION

1. Allowable Height and Area 408.6
Heights and Areas are based upon type of construction used.
2. Types of Construction 601 to 609, inclusive
3. Exit Requirements 512.5 to 512.18 inclusive
4. Protection of Vertical Openings 701 to 701.4, inclusive
5. Protection of Wall Openings 703 to 703.7, inclusive
6. Sprinklers and Standpipes Required 901 to 902, inclusive
7. Mixed Occupancy Separations 412
8. Light, Ventilation and Sanitation 2001 to 2002, inclusive
9. Heating Requirements Chapter VIII

408.5 — SPECIAL REQUIREMENTS — GROUP "E" OCCUPANCY

SECTION

1. Separation of Boiler or Furnace Room 801.2
2. Special Exit Doorway Requirements 1110
3. Non-combustible Stairway Requirements 1108
4. Gas Feed Lines, Protection Required 809
5. Special requirements governing the necessary features for total protection of Group "E" Assembly Occupancies, shall be in accordance with Section 512.
6. Tents 504.2
7. Bowling Alleys 513
8. Stadiums and Grandstands 510
9. Amusement Park Buildings 511
10. Restaurants, Ratproof Construction Required Chapter XIX
11. Storage and handling of flammable liquids shall be prohibited.

408.6. GROUP "E" ASSEMBLY OCCUPANCY—HEIGHT AND AREA RESTRICTIONS **ALLOWABLE HEIGHT** **ALLOWABLE FLOOR AREA**

Type Construction Used

Area Per Floor (sq. ft.)

	Story Height	One Story	Two Stories	Over Two Stories
Type I—Fireproof	No Limit	No Limit	No Limit	No Limit
Type II—Fire-Resistive	80 ft.	No Limit	No Limit	No Limit
Type III—Heavy Timber

Group E-2, with stage	One	5,000		
Group E-2, without stage	Two		Not Permitted	
Type VI—Wood Frame				
Group E-1	Not Permitted	4,000		
Group E-2, with stage	One	5,000		
Group E-2, without stage	Two		Not Permitted	
Group E-1	Not Permitted		1,500	
Group E-2, with stage	One			
Group E-2, without stage	One		Not Permitted	
		2,000		
		2,500**		

*One hour fire-resistive floors shall be required.

**May be increased 33 1/3 per cent for places of worship.

SECTION 409—GROUP "F"—STORAGE

409.1 — SCOPE

Buildings which are used for the storage of goods, wares or merchandise, excepting limited storage incidental to the display, sale or manufacture of such goods, wares or merchandise, shall be classified in Group F — Storage Occupancy.

Group "F" — Storage Occupancy — shall include, among others, the occupancies listed in this Section, but does not include buildings used to store highly combustible, inflammable or explosive products or materials (See Section 411):

Airplane Hangars

Warehouses

Coal Pockets

Storage Buildings

Garages

Freight Depots

409.2 — PROTECTIVE REQUIREMENTS — GROUP "F"—STORAGE SECTION

1. Allowable Height and Area	409.4
Heights and Area are based upon type of construction used.	
2. Types of Construction	601 to 609, inclusive
3. Exit Requirements	1101 to 1120, inclusive
4. Protection of Vertical Openings	701 to 701.4, inclusive
5. Protection of Wall Openings	703 to 703.7, inclusive
6. Sprinklers and Standpipes Required	901 to 902, inclusive
7. Mixed Occupancy Separations	412
8. Light, Ventilation and Sanitation	2001 to 2002, inclusive
9. Heating Requirements	Chapter VIII

409.3 — SPECIAL REQUIREMENTS — GROUP "F" — STORAGE SECTION

1. Separation of Boiler or Furnace Room	801.2
2. Non-combustible Stairway Requirements	1108
3. Occupancy Permit for Changed Floor Loads	1207
4. Posting of Floor Loads Required	110
5. Airplane Hangars	502
6. Coal Pockets	503
7. Garages	
Private	506
Public	508
8. Storage and handling of flammable liquids shall conform to	501.1 (f)
9. Ratproof Construction Required	Chapter XIX

409.4. GROUP "F"—STORAGE OCCUPANCY—HEIGHT AND AREA RESTRICTIONS

	ALLOWABLE HEIGHT Type Construction Used	ALLOWABLE FLOOR AREA** Area Per Floor (sq. ft.)		
		One Story	Two Stories	Over Two Stories
Type I—Fireproof	No Limit	No Limit	No Limit	No Limit
Type II—Fire-Resistive	Six	30,000	20,000	15,000
Type III—Heavy Timber*	Six	15,000	10,000	8,000
Type IV—Non-Combustible*	Four	13,500	9,500	7,000
Type V—Ordinary*	Four	12,800	8,500	7,000
Type VI—Wood Frame	One	5,000	Not Permitted	

*When over three stories in height, an approved automatic water sprinkler shall be installed throughout the building.

**May be increased beyond the areas set forth in the above table, (see Section 403).

SECTION 410—GROUP "G"—INDUSTRIAL

410.1 — SCOPE

Buildings in which work or labor is performed in connection with the fabrication, assembly, processing, etc., of products or materials shall be classified in Group G — Industrial Occupancy. Group G — Industrial Occupancy — shall include, among others, the occupancies listed in this Section, but does not include buildings used for any purpose involving highly combustible, inflammable, or explosive products or materials (See Section 411):

Manufacturing Plant
Factory
Assembly Plant

Processing Plant
Mill

410.2 — PROTECTIVE REQUIREMENTS — GROUP "G" — INDUSTRIAL

SECTION

1. Allowable Height and Area	410.4
(a) Exception to Area Restrictions	403
(b) Unlimited Areas	403.6

Heights and Areas are based upon type of construction used.

2. Types of Construction	601 to 609, inclusive
3. Exit Requirements	1101 to 1120, inclusive
4. Protection of Vertical Openings	701 to 701.4, inclusive
5. Protection of Wall Openings	703 to 703.7, inclusive
6. Sprinklers and Standpipes Required	901 to 902, inclusive
7. Mixed Occupancy Separations	412
8. Light, Ventilation and Sanitation	2001 to 2002, inclusive
9. Heating Requirements	Chapter VIII
(a) Special High Temperature Requirements	803 to 804, inclusive
(b) High Pressure Boilers and Metal Smokestacks	804.4 to 804.5, inclusive
(c) Duct Construction	805

410.3 — SPECIAL REQUIREMENTS — GROUP "G" — INDUSTRIAL

SECTION

1. Occupancy Permit Required for Changed Floor Loads	1207
2. Posting of Floor Loads Required	110
3. Storage and Handling of Flammable Liquids Shall Conform to	501.1 (f)
4. Ratproof Construction Required Where Food Is Processed	Chapter XIX

410.4. GROUP "G"—INDUSTRIAL OCCUPANCY—HEIGHT AND AREA RESTRICTIONS

ALLOWABLE HEIGHT		ALLOWABLE FLOOR AREA*			
	Type Construction Used	Story Height	Area Per Floor (sq. ft.)		
			One Story	Two Stories	Over Two Stories
Type I—Fireproof		No Limit	No Limit	No Limit	No Limit
Type II—Fire-Resistive		80 ft.	No Limit	30,000	20,000
Type III—Heavy Timber**		Six	13,800	11,000	8,800
Type IV—Non-Combustible		Four	14,000	10,000	6,800
Type V—Ordinary		Four	10,000	8,500	6,800
Type VI—Wood Frame		One	6,500	Not Permitted	

*For unlimited areas see Section 403.6. Other allowable area increases see Section 403.

**In Type III buildings over 4 stories, sprinklers shall be required.

SECTION 411—GROUP "H"—SPECIAL HAZARDOUS

411.1 — SCOPE

Buildings or structures used for purposes that involve highly combustible, inflammable or explosive products or materials or that constitute exceptional fire hazards, because of the form, character or volume stored, processed or manufactured, shall be classified in Group H — Hazardous Occupancy.

GROUP H — Special Hazardous Occupancy — shall include, among others, the following:

Dry Cleaning Establishments	Storage or use of Highly
Grain Elevators	Combustible Materials
Storage of Combustible Film	

411.2

The processing, manufacturing or storing of the following materials in excessive quantities, when considered by the Building Official to be hazardous, among others, shall be classified as of special fire hazard, (Group "H"—Special Hazardous Occupancies) constituting highly combustible, inflammable, or explosive products or materials.

Acetylene Gas	Feather Renovating
Acids: Sulphuric, Nitric or Hydrofluoric	Fertilizer
Artificial Flowers	Films, Combustible
Artificial Leather	Fireworks
Asphaltum	Flour and Feed
Bags: Second Hand, Burlap, Cotton, Paper, Jute	Fuel, Gas and Oil
Barrels, Second Hand	Gas: Poisonous, Irritating and Flammable.
Brooms and Broom Corn	Hair
Calcium Carbide	Hemp
Carpet Linings	Japanning or Enameling
Celluloid	Jute
Chemicals: Irritating, Poisonous, Combustible, Explosive	Kapok
Cotton: Bales, Bolts, Wadding and Waste	Lacquers
Cereal Mills	Matches
Cork	Mattresses
Drugs	Munitions
Excelsior	Naval Stores
Petroleum Products	Nitrate of Soda
Plant Fibre, Loose	Oakum
Pyroxylin and Pyroxlin Plastic Products	Paper: Baled Waste
Rags	Paints
Shoddy Mills	Starch Mills
Spices and Vegetable Stocks	Straw
Spray Painting Shops	Textiles
Explosives	Tires
	Tow
	Varnish, Turpentine
	Waste Paper

411.3 — PROTECTIVE REQUIREMENTS — GROUP "H" — SPECIAL HAZARDOUS

	SECTION
1. Prohibited in Fire Districts	301
2. Allowable Height and Area	411.5
Heights and Areas are based upon types of construction used.	
3. Types of Construction	601 to 609, inclusive
4. Exit Requirements	1101 to 1120, inclusive
5. Protection of Vertical Openings	701 to 701.4, inclusive
6. Protection of Wall Openings	703 to 703.7, inclusive
7. Sprinklers and Standpipes Required	501.2 (d), and 901 to 902, inclusive
8. Light, Ventilation and Sanitation	2001 to 2002, inclusive
9. Heating Requirements	Chapter VIII
10. Duct Construction	805
11. Separation of Boiler or Furnace Room	801.2
12. Mixed Occupancy Separation	412

411.4 — SPECIAL REQUIREMENTS—GROUP "H"—SPECIAL HAZARDOUS

The hazards involved under Group "H"—Special Hazardous—require provisions that give adequate protection for these special occupancies. The occupancies in this group shall conform to the special requirements as set forth in Section 501.

411.5. GROUP "H"—SPECIAL HAZARDOUS OCCUPANCIES, HEIGHT AND AREA RESTRICTIONS

	ALLOWABLE HEIGHT Type Construction Used	ALLOWABLE FLOOR AREAS*		
		Area Per Floor (sq. ft.)		
	Story Height	One Story	Two Stories	Over Two Stories
Type I—Fireproof	Four	11,500	7,500	5,000
Type II—Fire-Resistive	Three	8,300	6,000	4,000
Type III—Heavy Timber	Two	7,500	6,000	Not Permitted
Type IV—Non-Combustible	One	5,000	Not Permitted	
Type V—Ordinary	One	5,000	Not Permitted	
Type VI—Wood Frame	Not Permitted			

*No modification in areas shall be permitted in Group "H" Special Hazardous Occupancies.

Note:—See Chapter V for special and detail requirements of Group "H" Special Hazardous Occupancies.

SECTION 412—MIXED OCCUPANCY AND SEPARATION REQUIREMENTS

412.1 — DEFINITION

When a building is used for two or more occupancies, classified within different occupancy groups, it shall be considered a mixed occupancy.

412.2 — LIMITATIONS

A mixed occupancy building shall be governed by the height and area limitations applying to the occupancy for which those limitations, as specified in this Code, are the most restrictive.

412.3 — SEPARATION

For each occupancy, the type of construction may be as prescribed for such occupancy in a building of the height and area of the building as a whole, provided each occupancy is wholly separated, horizontally and vertically, by constructions having fire-resistance ratings equivalent to the higher rating prescribed for the two occupancies being separated, as noted in Section 412.5.

412.4 — MINIMUM SEPARATION

Unless, as otherwise specifically prescribed in this Section, the separation of mixed occupancies shall provide not less than one (1) hour of fire protection, except that portions of buildings used as accessory offices, or for customary non-hazardous uses necessary for transacting the principal business of Group F. Storage, and Group G, Industrial, may be separated by partitions constructed of materials as permitted in the type of construction used.

412.5 — FIRE-RESISTIVE RATING OF SEPARATION

The minimum fire resistance of constructions separating any two occupancies in a building of mixed occupancy, shall be the higher rating required for the occupancies being separated, as specified below:

MINIMUM REQUIREMENTS*

Group A—Residential	1 Hr. fire-resistive separation
Group B—Business	1 Hr. fire-resistive separation
Group C—School	2 Hr. fire-resistive separation
Group D—Institutional	2 Hr. fire-resistive separation
Group E-1—Large Assembly	4 Hr. fire-resistive separation
Group E-2—Small Assembly	2 Hr. fire-resistive separation
Group F—Storage	4 Hr. fire-resistive separation
Group G—Industrial	2 Hr. fire-resistive separation
Group H—Special Hazardous	4 Hr. fire-resistive separation

A separation between a private garage and any occupancy shall be the minimum fire resistance specified above for the occupancy, except in the case of a dwelling combustible framing shall be protected on the garage side with materials not less fire-resistive than the protection of such framing is one-hour construction.

*For materials and assemblies to provide the required fire-resistive construction, see Chapter X.

412.6 — PROTECTION OF HORIZONTAL OPENINGS

For requirements governing the protection of door openings in walls and partitions separating mixed occupancies, see Section 703.4.

412.7 — PROTECTION OF VERTICAL OPENINGS

For requirements governing the protection of vertical openings, see Section 701.

CHAPTER V

SPECIAL OCCUPANCY REQUIREMENTS

SECTION 501—GROUP H: HAZARDOUS OCCUPANCIES

501.1 — GENERAL REQUIREMENTS

(a) Buildings of occupancies in Group H not specifically provided for in this code, which involve the storage, manufacture, or use of highly combustible or flammable materials shall be constructed to provide a degree of fire protection adequate for the hazard involved. Such protection may exceed the fire-resistive requirements prescribed for Type I, Fireproof construction, if deemed necessary by the Building Official, but in all cases the construction shall meet the minimum requirements specified for Group H occupancies.

(b) Approved automatic sprinklers shall be installed throughout all buildings of Group H occupancies except that where the nature of the fire hazard is such that application of water is not effective as a means of protection other approved means of protection shall be provided.

(c) Buildings of Group H occupancies shall not be located in Fire District No. 1.

(d) Warehouses used to store combustible fibres such as cotton, sisal, jute, hemp, kapok, excelsior and similar materials having a flash fire hazard, shall be limited to story heights of not over 12 feet, floor to ceiling, and no single storage compartment shall exceed 5,000 square feet in floor area or 36,000 cubic feet in capacity.

(e) Stables, for storing hay, which do not exceed 1 story and storage loft, or a maximum of 20 feet in height, and do not exceed 3,000 square feet in floor area, may be of Type VI Wood Frame construction if located 30 feet or more from adjoining property lines and other structures.

(f) Buildings or structures of occupancies involving the use of highly combustible material or processes, and their equipment, shall be erected, altered, and installed in accordance with safe practice. Except as otherwise provided in this code, the provisions of the various regulations or standards of the National Fire Protection Association governing the particular occupancy shall be considered as constituting safe practice. Those standards include, among others, the following:

N. F. P. A. Suggested ordinance regulating the use, handling, storage and sale of flammable liquids and the products thereof (National Fire Codes, Volume I, 1948 Edition (also separate pamphlet 30-L).

N.F.P.A. Standards for paint spraying and spray booths (National Fire Codes, Volume I), 1948 Edition).

N.F.P.A. Standards for dip tanks containing flammable liquids, including hardening and tempering tanks and floor coat work (National Fire Codes, Volume I, 1948 Edition).

N.F.P.A. Standards for the installation and operation of gas systems for welding and cutting (National Fire Codes, Volume I, 1948 Edition).

N.F.P.A. Standards for the design, installation and construction of container and pertinent equipment for the storage and handling of liquified petroleum gases (National Fire Codes, Volume I, 1948 Edition).

N.F.P.A. Recommended good practice requirements for the installation and use of internal combustion engines (National Fire Codes, Volume I, 1948 Edition).

N.F.P.A. Standards for storage and handling of pyroxylin plastics in warehouses and wholesale jobbing and retail stores (National Fire Codes, Volume I, 1948 Edition).

N.F.P.A. Standards for the storage, handling and use of pyroxylin plastics, in factories making articles therefrom (National Fire Codes, Volume I, 1948 Edition).

N.F.P.A. Standards for the storage and handling of combustible fibres (National Fire Codes, Volume III, 1944).

N.F.P.A. Standards for the installation and operation of acetylene equipment for lighting, heating and cooking (National Fire Codes, Volume I, 1948 Edition).

N.F.P.A. Standards for the installation, maintenance and use of gasoline vapor gas machines, lamps and systems (National Fire Codes, Volume I), 1948 Edition).

N.F.P.A. Fundamental principles for the prevention of dust explosions in industrial plants (National Fire Codes, Volume II, 1950 Edition).

N.F.P.A. Code for the prevention of dust explosions in the manufacture of aluminum bronze powder (National Fire Codes, Volume II), 1950 Edition).

N.F.P.A. Code for explosion and fire protection in plants producing or handling magnesium powder or dust (National Fire Codes, Volume II, 1950 Edition).

N.F.P.A. Code for the prevention of dust explosions in flour and feed mills (National Fire Codes, Volume II, 1950 Edition).

N.F.P.A. Code for the prevention of dust explosions in starch factories (National Fire Codes, Volume II, 1950 Edition).

N.F.P.A. Code for the prevention of dust explosions in wood-working factories (National Fire Codes, Volume II, 1950 Edition).

N.F.P.A. Code for the prevention of dust explosions in the plastics industry (National Fire Codes, Volume II, 1950 Edition).

Note: The above standards published by the National Fire Pro-

tection Association in the several volumes of National Fire Codes may be obtained from them at 60 Batterymarch Street, Boston, Mass.

501.2—DRY CLEANING, DYEING OR SIMILAR HIGH FIRE HAZARD OCCUPANCY

(a) No building used for dry cleaning or similar hazardous occupancy shall be located within Fire District No. 1, unless only non-flammable liquids are used for cleaning purposes.

(b) Dry cleaning, dyeing, or similar establishments using combustible or flammable liquids or solvents with a flash point of 190° F. or lower (closed cup test), shall be of Type I, Fireproof, or Type II, Fire Resistive construction, and shall not exceed 1 story in height or 10,000 square feet in area, without attics, concealed roof spaces, basements or pits. Floors shall not be below grade.

(c) Roof shall be flat. If, due to local conditions, the Building Official deems it desirable to vent possible explosions upward, the roof may be of light, non-combustible construction.

(d) An approved automatic sprinkler system shall be installed throughout each dry-cleaning room and drying room in accordance with Section 901 of Chapter IX.

(e) Partitions shall be of not less than 2-hour fire-resistive construction, as set forth in Section 1002.

(f) Drying rooms, if under the same roof as the dry cleaning and dry dyeing rooms, shall be separated from such rooms by each wall having a fire resistance of not less than 4 hours. The entrance to such drying rooms shall be provided with self-closing fire doors.

(g) Except for necessary openings for vents, ducts, piping and shafting, all openings in exterior walls shall be protected with fire-resistive doors or windows. Windows shall be of wire glass in metal sash so hung that they will readily swing out in case of explosion.

(h) Exterior walls except those on street fronts, which are located less than 10 feet from adjacent property lines shall have no openings therein and shall have a fire resistance rating of not less than four hours, or the equivalent, but in no case shall more than two sides of the building have blank walls.

(i) Skylights shall be provided. They shall be constructed with metal frame and sash with plain thin glass and with wire screen provided above the skylight as prescribed in Section 707, or with wire glass arranged to swing outward readily in case of an explosion.

(j) Mechanical systems of ventilation, of explosion-proof type, shall be provided to insure complete and continuous change of air once every 3 minutes in dry-cleaning and dry-dyeing rooms.

(k) All other regulations contained in this code pertaining to construction, ventilation, storage, heating and lighting, or the like, shall apply as well as any laws of the State regulating the construction and maintenance of dry-cleaning, dyeing, or similar plants.

(1) The installation, ventilation, erection, alteration, maintenance or use of equipment, of buildings or structures for dry-cleaning or dry-

dyeing purposes shall be in accordance with the provisions of the "Standards of the National Fire Protection Association for safeguarding Dry Cleaning and Dry Dyeing Plants" (National Fire Codes, Volume I, 1948 Edition).

501.3—HANDLING OR STORAGE OF COMBUSTIBLE FILM

(a) Construction of Buildings Where Films Are Stored or Processed

All buildings in which films are stored or processed, such as film exchanges, film laboratories, motion picture studios, etc. shall be of Type I or Type II construction and shall be equipped throughout with approved automatic sprinklers in accordance with Section 901 of Chapter IX. Such buildings shall not be located in Fire District No. 1 and shall not exceed the maximum height and area limitations specified for Group H in Section 411.5.

The following regulations shall govern the handling and storage of combustible film except that they do not apply to the following: Films in original packages in quantities less than 50 cubic feet, and films stored in motion picture projection booths (See Section 512.25).

Except as otherwise specified herein, the handling and storage of combustible film shall be governed by the "Standards of the National Fire Protection Association for Nitrocellulose Motion Picture Film" and for the "Storage and Handling of Photographic and X-Ray Nitrocellulose Films." (National Fire Codes, Volume I, 1948 Edition).

All rooms in which combustible films are stored or handled, except motion picture projection booths and film vaults, shall be enclosed in partitions of non-combustible construction having not less than 2 hours fire resistance. Openings in such partitions shall be protected by approved fire doors. Floors and ceilings of such rooms shall provide fire resistance of not less than 2 hours and vents that open automatically in case of fire shall also be provided. Tables and racks used in connection with the handling of film shall be of metal or other non-combustible material and shall be at least 4 inches away from any radiator or heating apparatus. Fire-fighting appliances using water, or water solutions, shall be provided in every room. In rooms where film is stored or handled in quantities greater than 50 lbs., cabinets shall be provided with insulated metal vents. Film storage rooms in which two or more persons work, shall have at least two exits remote from each other.

Combustible film in amounts of more than 1,000 lbs. shall be kept in vaults constructed as prescribed in this section.

Amounts of combustible film in excess of 25 lbs. shall be kept in approved metal cabinets of capacity not exceeding 375 lbs. Cabinets having a capacity of over 50 lbs. of film, shall be provided with insulated metal vents of at least 14 square inches per 100 lbs. of film. Cabinets holding over 75 lbs. of film shall be provided with at least one automatic sprinkler, unless so built that each roll is in a separate

compartment so constructed that the film will burn out without communicating fire to film in any other compartment.

Unexposed film, when stored in the original shipping cases with each roll in a separate container, shall be stored only in a room provided with an approved automatic sprinkler system. (Section 901 of Chapter IX.)

(b) Film Vaults

Vaults used for the storage of combustible film shall not exceed 750 cubic feet inside and shall not be located near chimneys or other sources of heat.

Walls, floors and roofs of film vaults and their supports shall be of not less than 4-hour fire resistive construction built without cracks or holes that will permit escape of gases. Drains or scuppers, to the outside of the building shall be provided. All door openings shall be protected with approved fire doors on each face of the wall; the inner door shall be automatic, the outer door shall be of the self-closing swinging type.

Each vault shall have an independent vent having not less than 140 square inches effective area per 1,000 lbs. of film capacity (equivalent to 70 square inches per 100 standard rolls) but the vent area for a vault of 750 cubic feet shall in no case be less than 1400 square inches. Vents shall be of non-combustible materials and shall be located at least 50 feet from all openings exposed thereto.

Film shall be protected against ignition by rays of the sun and by radiated heat.

Vaults shall have no skylights or glass windows except as specified for vents. Vents may be protected against the weather by a single thickness of glass (1/16" thick) not less than 200 square inches in area, in a sash arranged to open automatically in case of fire, or by equivalent protection.

Vaults shall be protected by an approved system of automatic sprinklers (Section 901 of Chapter IX) with a ratio of one head to each 62½ cubic feet of total vault space. A vault of 750 cubic feet shall have not less than 12 sprinkler heads.

Wire guards shall be provided so that no film could be placed within 12 inches of heating pipes or radiators.

Vault heating shall be automatically controlled so as not to exceed a temperature of 70 degrees F. or a steam pressure of 10 lbs.

All racks and equipment in vaults shall be of metal or other non-combustible material.

501.4—GRAIN ELEVATORS

(a) Grain elevators, or structures used to store grain, shall not be located within 50 feet of adjoining property lines or other structures nor shall they be located within Fire District No. 1.

(b) Grain elevators, or structures used to store grain, shall be constructed of steel, concrete, or other non-combustible material or with lumber exterior or interior framing, including plank and laminated walls, when the sizes of the members used conform to the requirements for Type III—Heavy Timber Construction to meet the approval of the Building Official, and all such structures, buildings, and equipment shall be erected, altered, or installed in accordance with the provisions of Section 501.1 (f).

(c) Where combustible material, other than grain, is present in quantity sufficient to produce a serious fire, fire protection equivalent to Type I construction shall be provided unless approved automatic sprinkler protection is provided (Section 901 of Chapter IX). In no case, however, shall the requirements for grain elevators, or grain storage buildings, be less restrictive than those applying to Group H occupancies.

SECTION 502—AIRPLANE HANGARS

(a) Airplane hangars may be of any type of construction, except that if located within 50 feet of a common property line or of the opposite side of a public street or thoroughfare or other building, the hangar shall be of Type I, Fireproof, or Type II, Fire Resistive or Type III—Heavy Timber Construction.

(b) The floor areas of hangars shall not exceed those permitted for Group F storage buildings in Section 409.4 (see area exceptions, Section 403).

(c) Where hangars have basements, the floor over the basement shall be of Type I Fireproof construction and shall be made tight against seepage of water, oil or vapors. There shall be no opening or communication between basement and hangar. Access to basement shall be from outside only.

(d) Floors shall be graded and drained to prevent water or gasoline from remaining on the floor. Floor drains shall discharge through an oil separator to the sewer or to an outside vented sump.

(e) Heating of hangars shall be from plants located in a detached building.

(f) The process of "doping", involving use of a volatile flammable solvent, or of painting, shall be carried on in a separate detached building equipped with automatic sprinkler equipment in accordance with Section 901 of Chapter IX.

(g) Each hangar of area exceeding 10,000 square feet shall be equipped with approved automatic sprinklers in accordance with Section 901 of Chapter IX.

SECTION 503—COAL POCKETS

Coal pockets, and other similar structures, shall be constructed of steel, concrete, or other non-combustible material, or of lumber sizes which meet the requirements of Type III—Heavy Timber Construc-

to meet the requirements of this Code and the approval of the Building Official.

SECTION 504—TEMPORARY STRUCTURES

504.1 — PERMIT

A special building permit for a limited time must be obtained before the erection of Temporary Structures such as construction sheds, seats, canopies, tents and fences used in construction work or for temporary purposes such as reviewing stands. Such structures shall be completely removed upon the expiration of the time limited stated in the permit.

504.2 — TENTS FOR PUBLIC ASSEMBLY

Before a temporary permit is granted, the owner or agent shall file with the Building Official a certificate executed by an acceptable testing laboratory, certifying that the tent, decorative materials and tarpaulins meet the fire-resistive requirements of Federal Specification CCC-D-746 and that such fire-resistance is effective for the period for which the permit is to be granted.

(b) Ground within and adjacent to tents shall be cleared of all grass, underbrush or similar fire hazards.

(a) **Tent Exits**—Tent exits, aisles, seating, etc., shall conform with the requirements for places of assembly. All exits shall be kept free and clear of obstructions while the tent is occupied by the public.

504.3 — TEMPORARY SEATS

A special permit shall not be issued unless all seats, stands and structures conform to the requirements of Section 1203 of Chapter XII (Minimum Design Loads). All seats shall be marked allowing a space for each person of not less than eighteen inches in width. Aisles and seating arrangements shall conform to the requirements of Assembly Occupancies (Section 512.12).

SECTION 505—FILLING STATIONS

505.1

Filling stations of Group B shall include buildings on lots used for the purpose of supplying motor fuel to tanks of motor vehicles for immediate use. Such buildings shall have no cellars or basements but may have open pits if such pits are continually ventilated. Filling stations shall be of Type I, Fireproof; Type II, Fire Resistive; Type III, Heavy Timber; Type IV, Non-Combustible; Type V, Ordinary, or Type VI.

505.2

Filling stations having their exterior walls located 20 feet or less from property lines, or adjacent buildings, shall be constructed of non-combustible materials, or of construction providing 1-hour fire resistance, when the total floor area of the station exceeds 1,000 square feet. No openings shall be placed in exterior walls of filling stations

which are located 5 feet or less from property lines or adjacent structures.

505.3

Canopies and their supports, over pumps, shall be of non-combustible materials, or of construction providing 1-hour fire resistance.

505.4

All equipment likely to cause an explosion, or to be capable of igniting gasoline vapor from heat, sparks, or open flames, shall be located at least 4 feet above the floor, or be completely and tightly enclosed by non-combustible construction, or construction of not less than 1-hour fire resistance. Any opening to such enclosures shall be from the outside with the sill raised at least 1 foot above the adjoining outside level, and shall be located at least 5 feet from any property line or adjacent building.

SECTION 506—PRIVATE GARAGES

506.1

Garages which are provided for the storage of motor vehicles owned by tenants of buildings on the premises, and with maximum undivided space used for storage of not more than four automobiles, or trucks of one ton or less capacity, but not exceeding 850 square feet, shall be considered private garages. All other garages shall be considered public garages.

506.2

Private garages may be of Type I, II, III, IV, V or VI construction, but no private garage shall occupy space above the first floor of Type VI building or shall be erected in the fire districts except as provided in Section 304.2. No private garage shall be located within, or attached to, a building occupied for any other purpose, unless it is separated from such other occupancy by walls, partitions, floors and ceilings that have a fire-resistance rating as specified in Section 412.5 (Mixed Occupancy Separations). Walls, floors, partitions and ceilings that effect such separation shall be continuous and unpierced. A single flush-type solid core wooden door of not less than 1 $\frac{3}{4}$ inch nominal thickness, equipped with a self-closing device, may be permitted provided the sill is raised at least 8 inches above the garage floor when the door-way connects directly with any room in which there is any direct-fired heating device or gas fixture. In no case, however, shall a garage have an opening directly into a room used for sleeping purposes.

SECTION 507—PARKING LOTS

Open sheds or canopies may be erected up to two-thirds (2/3) the area of a lot, provided such construction is not less than required for Type IV, Non-combustible, and that all such constructions meet the approval of the Building Official.

SECTION 508—PUBLIC GARAGES

508.1

A garage shall be any building or part thereof, wherein is kept or stored a motor vehicle having any gasoline or other volatile inflammable oil in its fuel storage tank, or wherein the painting, repairing, or greasing of motor vehicles is performed. A garage exceeding 850 square feet in area, or used to store more than four automobiles, shall be considered a public garage.

508.2

Public garages shall be of Type I, II, III, IV, V, or VI construction. If of Type V construction it shall not exceed one story in height, but shall not exceed the maximum height and areas allowed for Group F storage buildings. Public garages of Type VI may be used only for dead storage and display of automobiles.

508.3

A truck loading area may extend within a building of Group B, F or G occupancy, if open on one side, but the construction within and enclosing such area shall provide fire resistance not less than required for Type V Ordinary construction.

508.4

No public garage shall be located within, or attached to, a building occupied for any other purpose, unless it is separated from the other occupancies as prescribed in Section 412, but in no case by walls having fire resistance less than two hour Fire Resistive construction. Such separation shall be continuous and unpierced, except for doors leading to salesrooms, or offices, operated in connection with such garages, provided such openings are approved by the Building Official as being required or essential, and provided such openings are equipped with self-closing fire doors conforming to the requirements of Section 703.

508.5

Unenclosed ramps shall not be considered as providing required exit facilities. Enclosed ramps shall be in accordance with the Exit Requirements of Section 1105.5 and with Chapter XI, Exit Requirements.

508.6

Basement and subbasement garages shall be continuously ventilated by a mechanical system with positive means for both inlet and exhaust of at least 1 cubic foot of air per minute per square foot of floor area, controlled from a location close to the entrance door.

508.7

Garage floors shall be covered with concrete or similar non-com-

bustible and non-absorbent material. Floors which drain to sewers or storm drains shall be provided with an oil separator or trap.

508.8

Sprinkler equipment shall be provided as specified in Section 901 of Chapter IX.

508.9

Heating equipment, other than direct-fired unit heaters, shall be placed in a separate room cut off by construction equivalent to 8-inch brick walls and 4-inch reinforced concrete floor and ceiling with no opening except as required for heating pipes and ducts and with outside entrance only.

508.10

Connection between garage and any room having a direct-fired heating device, or gas fixture, shall be by means of a doorway with sill raised at least 8 inches above the garage floor level, or through a vestibule providing two doorway separations.

SECTION 509—GREENHOUSES

Greenhouses more than 35 feet in height shall have a non-combustible structural frame. Greenhouses not over 400 square feet in area, or 15 feet high, shall be considered accessory structures and may be of any construction except that any greenhouse with wood frames shall be located not less than 5 feet from any adjoining structure or property line.

SECTION 510—STADIUMS AND GRANDSTANDS

510.1

Stadiums and grandstands may be constructed of steel, iron, reinforced concrete, or wood, designed for live loads and for wind pressures in accordance with the requirements of this Code. They shall not be erected on the roof of any building or structure.

510.2

In stands constructed of wood or other combustible materials, the level of the highest seats above the ground (level of ground at immediate front of the stand) shall not exceed 25 feet, and such stands shall not be located within 20 feet of adjoining property lines, or within 50 feet of adjoining Type VI Wood Frame structures.

510.3

When the space under a stand is used for any purpose, the space shall be enclosed with not less than 1-hour fire-resistive construction and shall meet the separation requirements of Section 412.

510.4

Aisles not less than 3 feet 6 inches wide shall be provided so that

there are not more than 20 seats between any seat and an aisle. Where backs are provided, seats shall be spaced not less than 30 inches back to back.

510.5

A distance of 18 inches along any bench shall constitute one seat in figuring the required exit facilities.

SECTION 511—AMUSEMENT PARK BUILDINGS

511.1

Amusement park buildings used as dining rooms, theaters, or for other purposes shall conform to the requirements of this Code governing the particular use or occupancy.

511.2

Amusement park buildings over one story in height, or 1200 square feet in floor area, shall have exterior walls, floors and their supports of not less than 1-hour fire resistive construction.

511.3

Where amusement park buildings are located within 30 feet of adjacent property lines, buildings or other structures, the exterior walls shall be constructed of non-combustible materials, or shall be protected to provide not less than 1-hour fire resistance.

511.4

Structures of open skeleton frame type shall not be limited in height or area, except that grandstands shall comply with the requirements of Section 510.

511.5—AMUSEMENT STRUCTURES

Amusement structures shall provide adequate safety for all loads to which they may be subjected and shall be equipped with approved safety devices and safeguards.

SECTION 512—ASSEMBLY OCCUPANCIES

512.1 (a)—SCOPE

This section comprising sub-sections 512.1 through 512.27 shall apply to all places of public assembly, except churches or places of worship which shall be governed by the requirements of Section 514.

512.1 (b)—TYPES OF CONSTRUCTION

Buildings of Group E-1 large assembly shall be of Type I Fire-proof or of Type II Fire-Resistive Construction, except that in auditoriums, ornamental wood, trusses and paneling may be of wood.

Buildings of Group E-2 small assembly shall come within the limitations of use prescribed in Section 408.6 as modified herein.

Gymnasiums and similar occupancies may have running tracks constructed of wood or unprotected metal.

For requirements for stadiums and grandstands see Section 510, for amusement park structures see Section 511.

Exception to Area Limitations

Where there are no balconies or galleries in Group E-2, Small Assembly Places, and the assembly floor is located at, or within, 21 inches of street or grade level and all exits meet the street or grade level by ramps having a slope not exceeding 1 foot in 10 feet, the maximum allowable areas of Type III, IV, and V construction may be increased 50 per cent over those specified for Group E Assembly occupancies in Table 408.6.

512.2—INTERIOR FINISH AND DECORATIONS

Use of combustible materials or materials which develop toxic or noxious gases for interior wall finishes shall not be permitted in Group E Assembly occupancies, except as provided in Section 512.1 and in gymnasiums, wood wall covering may be used on the gymnasium walls. For regulations governing ceiling materials see Section 704.3.

In no event shall imitation leather or other material, consisting of, or coated with, a pyroxylin or similarly hazardous base, be used in Group E, Assembly occupancies. The use of combustible materials for decorative purposes in Group E Assembly occupancies, including, among others, curtains, cloth, paper, streamers, draperies, vines, leaves, trees, moss, or other interior decorations, shall be prohibited.

512.3—WALLS AND PARTITIONS

All walls enclosing stairs, passageways or corridors (except foyers or waiting space) which are used for exits, or enclosing rooms used for exit purposes in Group E, Assembly buildings, shall be of not less than 2-hour fire resistive construction.

Where Group E, Assembly occupancy is involved in a building used for any other purpose, separation of occupancies shall be as provided in Section 412.

512.4 — LOCATION OF BUILDING

All buildings of Group E, Assembly occupancy shall front directly upon at least one public street not less than 30 feet wide, in which front shall be located the main entrance and exit of such building.

512.5 — MAIN ENTRANCE DOORWAYS

In no case shall the minimum aggregate width of the main street entrance doorways be less than 10 feet, or less than 20 inches for each 100 persons of the first 1,500 persons or total capacity; 15 inches for each 100 persons over 1,500 but under 2,500 persons, and 10 inches for each 100 persons in excess of 2,500 persons in total capacity. Not more than one step of 8 inches shall be used for such main entrance and exit above the sidewalk, and no gradient shall exceed 1 in 10. Main street entrance doorways shall be in addition to required emergency exit doorways, as set forth in Section 512.9—Main Floor Exits.

512.6 — FOYER

In every Group E-1, Large Assembly Places, a foyer consisting of a space at the main entrance of the auditorium or place of assembly shall be provided. Such foyer, if not directly connected to a public street by all the main entrances or exits, shall have a straight and unobstructed corridor or passage to every such main entrance and exit, equal in minimum width to that required for the main entrance and exit.

The width of foyer at any point shall not be less than the combined width of aisles, stairways, and passageways tributary thereto, but need not exceed the required width of main entrance. The foyer shall be at the same level as the back of the auditorium, and exits leading therefrom shall not have a steeper gradient than 1 foot in 10.

512.7 — WAITING SPACES

In theaters and similar Group E, Assembly occupancies, where persons are admitted to the building at times when seats are not available and are allowed to wait in a lobby or similar space, such use of lobby or similar space shall not encroach upon the required clear width of exits. Such waiting areas shall be separated from the required exit ways by substantial permanent partitions or by fixed rigid railings not less than 42 inches high. Additional exits conforming to the requirements of Section 512.8 shall be provided for such waiting space area on the basis of one person for each 3 square feet of waiting area.

512.8 — EXITS

No Group E-2, Small Assembly Place, shall have less than two exitways and no Group E-1, Large Assembly Place, shall have less than three exitways except that where more than 1,000 persons are accommodated there shall be at least four exitways. Exits shall be located as remotely from one another as practicable.

Exit through any room or space used as a kitchen, or for preparation of food, shall not be permitted except under such conditions as may be prescribed and approved by the Building Official.

The aggregate clear width of emergency exits from Group E, Assembly occupancies, shall not be less than 22 inches for each 100 persons accommodated, or where no seating arrangements are provided, less than 22 inches for each 1,500 square feet of gross floor area served by such exits, except that where such place of assembly is located in a story above street level, the aggregate width of emergency exits shall be not less than 22 inches for each 450 square feet of gross floor area served by those exits. These emergency exit requirements are in addition and supplemental to the main entrance and exit requirements of Section 512.5.

512.9 — MAIN FLOOR EXITS

In Group E, Assembly occupancies, exits not less in width than the full width of the aisle or aisles leading thereto, shall be provided at the rear of the auditorium or place of assembly, leading into the foyer or into a passageway to the street.

Additional emergency exits located in the front half of the auditorium, preferably on each side, shall be provided on the main floor of all Group E, Assembly occupancies. The number of exits shall be as required in Section 512.8. Exits shall be divided approximately equally on each side of the auditorium.

Exits shall be so located that maximum distance of travel to an exit shall not be greater than 100 feet.

Doorways in required emergency exits of main floor shall have a minimum clear width of 5 feet. The aggregate width of the emergency exit shall be not less than required by Section 512.8.

Exits shall have doors opening outward, and shall open directly upon a street or upon an exit court, or upon corridors connected with an exit court. Each such corridor shall have a width not less than the required width of the largest door opening into the corridor plus one-half the sum of the widths of all other doors leading into the corridor, but in no case less than 80 per cent of the aggregate width of all such openings. There shall be no openings other than exits in such corridors. Exit doors shall be hung so as not to decrease the required width of passageway.

512.10 — BALCONY AND GALLERY ENTRANCES AND EXITS

For balconies or galleries of Group E, Assembly occupancies having a seating capacity of over 50, at least two exits shall be provided, one from each side of every balcony or gallery, leading directly to a street or exit court. The number of exits shall not be less than specified in Section 512.8.

All exits shall be served by stairs or ramps completely enclosed and protected as elsewhere prescribed in this Section. Such exits, from balconies or galleries, shall have a total aggregate width of not

less than 22 inches for each 150 persons or seats, or major fraction thereof, in the balcony or gallery served by such exits where fixed seating arrangements are used, or not less than 22 inches for each 1,000 square feet gross floor area where no seating arrangement is provided. No exit shall be less than 44 inches clear width.

Emergency exits shall be located remote from main exits and from each other and shall be equally divided on each side of balcony or gallery. Exits shall be so located that maximum travel distance from any seat to an exit shall be not greater than 100 feet.

Exits leading from balcony to foyer shall have a combined width of not less than 22 inches for every 150 seats or major fraction thereof. The lowest flight of stairs to a public lobby or foyer on the main floor may be open when such lobby or foyer is separated from the place of assembly by 2-hour fire resistive walls with protected openings.

All exits which are combined shall continue the full combined width to the street.

Stairs emptying into exit courts shall be located to meet the court floor at a clear distance at least equal to the stair width from the near side of any main floor exit into such exit court.

512.11 — EXIT COURTS

All exits of Group E, Assembly occupancies, not opening directly upon a street, shall be accommodated or served by an exit court consisting of a space open to the sky or a passageway of Type I Fireproof, or Type II Fire Resistive construction. Such courts shall be not less than 5 feet in width, but in no case of less width than required for exit doorways in section 1105.3. Such courts shall extend full width to a street, or shall be connected to the street by a passageway or corridor of the same required width, not less than 7 feet in height, of Type I Fireproof construction. Where enclosed passageways are used, they shall be vented to the outer air by wire mesh grilles with ventilation area at least equal to one-tenth of the floor area of such exit passageway. Slope of courts or passage shall not exceed one in 10. All door openings into courts or passageways shall be arranged not to decrease the required clear width of court when open. Where an exit passage extends through the stage portion of a theater, or place of assembly, there shall be no opening between such stage portion and the exit court.

512.12 — AISLES AND SEATING

Every aisle shall lead to an exit door or to a cross aisle running parallel to the seats and leading directly to an exit.

Aisles, cross-aisles, corridors, and passageways shall be of width at least equal to the minimum width required for exits in this Code, but in no case shall the width of an aisle or cross-aisle be less than the width of the widest aisle, passage, cross-aisle or exit which it serves. No aisle shall be less in width than 36 inches, measured at its

narrowest point at the end farthest from the foyer, plus an increase of 1½ inches for each 5 feet of length of such aisle from its beginning to an exit, except that aisles with seats on one side only may be 6 inches less in width, and except that when not to exceed 60 seats are served by an aisle, its width may be 30 inches. Where egress is provided at both ends of an aisle, the aisle may have a uniform width not less than the average widths herein specified. No cross-aisle shall be less than 3 feet-6 inches wide. An aisle bordering on a means of entrance shall be not less than 4 feet wide.

In all balconies and galleries having more than 20 rows of seats, there shall be provided a cross-aisle not less than 4 feet wide leading directly to an exit.

There shall be no obstructions of any kind in any aisle. Aisles shall not have a slope of more than one in ten except that the maximum gradient in aisles on the main auditorium floor shall not exceed one in five. Ramps steeper than one in eight shall have non-slip surface.

Rows of seats between aisles shall have not more than 14 seats.

Rows of seats opening on to an aisle at one end only shall have not more than 7 seats. Seats without dividing arms shall have their capacity determined by allowing 18 inches per person.

Exits and aisles shall be so located that the travel distance to an exit door shall not be greater than 100 feet measured along the line of travel.

Steps shall not be used in aisles of the main auditorium floor, or in other aisles, where differences of level can be overcome by gradients not exceeding those permitted herein. Where steps are used in aisles, such steps shall extend across the full width of aisles and shall be illuminated; treads and risers shall be as required elsewhere in the Code for exit stairs. No isolated steps shall be permitted nor shall the aggregate rise of a group of steps exceed 21 inches.

In Group E, Assembly occupancies seating more than 200 persons, seats shall be securely fastened to the floor. All seats in balconies or galleries shall be secured to the floor except that in railed-in enclosures, boxes, or loges, with level floors and having no more than 14 seats, the seats need not be fastened.

The spacing of rows of seats from back to back shall be not less than 30 inches, and not less than 27 inches plus the sum of the thickness of the back and the inclination of that back; but in all cases there shall be a space of not less than 12 inches between the back of one seat and the front of the seat immediately behind it as measured between plumb lines.

512.13 — RAILINGS

The facia of boxes, balconies and galleries shall have substantial railings not less than 26 inches high above the floor. The railing at the ends of aisles extending to the facia shall be not less than 30

inches high for the width of the aisle, or 36 inches high if at foot of steps.

Cross-aisles, except where the backs of seats on the front of the aisle project 24 inches or more above the floor of the aisles, shall be provided with railings not less than 26 inches high.

In balconies, galleries, or other locations where seats are arranged on platforms or successive tiers, and the height of the rise from one platform to another exceeds 21 inches, a substantial railing of not less than 30 inches high shall be placed at the edge of the platform along the entire row of seats.

512.14 — STAIR CONSTRUCTION

Stairs in all buildings of Group E, Assembly occupancy over two stories in height shall be of non-combustible construction, meeting the requirements of Section 1108 and shall conform with all the exit requirements.

512.15 — EXIT DOORS

Doors and gates shall conform to the requirements of Section 1110, Doorways; and Section 1105.3, Doorways and Horizontal Exits.

512.16 — EXIT LIGHTS

All exits shall be marked with illuminated signs bearing the word "EXIT" in letters at least six inches high. Where electric current is the source of lighting of the building, each sign shall be provided with two separate electric light globes on separate circuits, one such circuit being separate from any other circuit in the building. All exit signs shall be illuminated at all times when the building is occupied, by a reliable light source of not less than 25 watts or equivalent photometric rating that will be readable easily at a distance of 100 feet.

512.17 — PLACARD INDICATING CAPACITY

A placard indicating the allowable maximum legal capacity of every Group E, Assembly occupancy, in number of occupants other than employees, shall be displayed in a prominent place. Such signs shall read as follows:

"Occupancy by more than _____ persons is dangerous and unlawful."

Building Official

512.18 — EXIT OBSTRUCTIONS

No obstruction shall be placed in any aisle, exit, foyer, passageway or corridor.

Where the floor space of a Group E, Assembly occupancy, is occupied by tables, chairs, or other movable furniture, aisles at least 36 inches in clear width shall be maintained to provide ready access to exit doorways.

512.19 — CONSTRUCTION OF STAGE, PROSCENIUM AND APPURTENANT ROOMS

Any stage equipped for theatrical or similar performances that provides for the use of a curtain, portable or fixed scenery, light, or mechanical appliances, shall be enclosed on all sides with walls having a fire resistance of not less than 4 hours and extending from foundation to a height of 4 feet above the roof.

There shall be no openings in the wall separating the stage from the auditorium except the stage or proscenium opening, one doorway at each side of the proscenium opening at the stage floor level, at the level of the musicians pit, and where necessary to the organ. Each such doorway shall be not more than 21 square feet in area and shall be protected by an automatic fire door on one side of the wall and a self-closing fire door on the other side of the wall. Door openings leading from the stage to the outer air shall be equipped with approved self-closing fire doors.

There shall be no windows in such enclosure walls within 5 feet of property line other than a street line, and all windows shall be of approved fire-resistive type.

All mouldings and decorations around proscenium opening shall be constructed entirely of non-combustible or fire-resistant materials.

Above the proscenium opening shall be a girder or other structural member of adequate strength to support all loads, constructed of non-combustible material and protected to provide not less than 4-hour fire resistance.

All that portion of the stage except that used for the working of scenery, traps and other mechanical apparatus for the presentation of a scene, approximately equal to the width of the proscenium opening, shall be of Type I Fireproof construction, and all appurtenant rooms and compartments shall be of Type I Fireproof or Type II Fire Resistive construction.

The rigging loft, fly galleries, including pin-rails, shall be of non-combustible materials.

The roof over the stage shall be of Type I Fireproof construction.

Dressing rooms, scene docks, property rooms, workshops, store-rooms, and other rooms or compartments appurtenant to the stage shall be of Type I Fireproof or Type II Fire Resistive construction and shall be separated from the stage and other parts of the building by walls having a fire resistance rating of not less than 3 hours. Such rooms and spaces shall be separated from each other by non-combustible partitions providing not less than 2 hours fire resistance, except that partitions separating dressing rooms from each other shall have at least 1-hour fire resistance. In no case shall openings other than the necessary doorways at stage level, protected with self-closing fire doors, connect such rooms with the stage.

Openings through stage floors shall be equipped with tight-fitting trap doors of wood not less than 2 inches thick.

The troughs or frames for footlights and border lights shall be of metal or other non-combustible materials. The suspension lines of border lights shall be of wire for at least 10 feet from the frames.

All electrical equipment shall be protected from falling objects and from contact with stage equipment, and shall conform with the city electrical requirements.

All wood work and all scenery, drapes, and sets used upon the stage shall be coated or treated by approved method to make them non-flammable or fire resistive.

All shelving, closets, etc., property rooms, or storage rooms, shall be constructed of metal or other non-combustible material.

512.20 — VENTILATION OF STAGE

Over the stage shall be provided one or more ventilators of metal or other non-combustible material, equipped with movable shutters or sash, having an aggregate clear area of not less than one-eighth the area of the stage, constructed to open automatically and instantly by approved heat-actuated devices. Suitable means for manual operation shall be provided in addition. If glass is used in the construction, only wired glass shall be used in such parts where the breaking of glass would cause it to fall on the stage.

512.21 — PROSCENIUM CURTAIN

Every proscenium opening shall be provided with a curtain of metal or other non-combustible material, so designed and constructed that for at least thirty minutes it will prevent all passage of flame and withstand without failure a temperature of not less than 1700 degrees F. and an air pressure normal to its surface of not less than 10 lbs. per square foot. When closed, proscenium curtain shall be reasonably tight against the passage of smoke. The Building Official may require a fire test or other satisfactory evidence of its sufficiency in respect to these requirements. Curtain shall be subjected to operating tests and be approved by the Building Official before initial performance shall be held and shall be lowered after every performance.

Every proscenium curtain shall overlap the proscenium opening by at least 2 feet at the top and 18 inches at each side, and shall slide vertically at each side within iron or steel grooves which shall have a minimum depth of 12 inches. Every such curtain shall be so arranged and maintained that, in case of fire, it would be released automatically and instantly by an approved heat-actuated device, and will descend slowly and safely by its own weight to completely close the proscenium opening within 30 seconds, taking not over 5 seconds for the bottom 5 feet. It shall also be equipped with effective devices to permit prompt and immediate closing of the proscenium opening by manual means.

No part of any proscenium curtain shall be supported by or fastened to combustible material.

512.22 — STAGE AND DRESSING ROOM EXITS

Not less than one exit to a street, exit court, or passageway to a street, 3 feet or more in width, shall be provided from each side of the stage of every Group E-1, Large Assembly Place, and from each side of the sub-stage or basement or cellar under the stage, and an exit not less than 30 inches wide shall be provided from each fly-gallery and from the gridiron. An iron ladder shall be provided leading from the gridiron to a scuttle in the stage roof; such scuttle shall be not less than 2 feet x 3 feet in size and shall be provided with a metal-covered or non-combustible trap door. Each tier of dressing rooms shall be provided with at least two means of egress, each not less than 2 feet-6 inches wide, one of which shall lead directly into an exit court or street. All exit stairs shall be constructed of non-combustible material as prescribed in Section 1108, Stair Construction. Stair exits from stage and dressing rooms need not be enclosed.

512.23 — SPRINKLERS

Every theater classified as a Group E-1, Large Assembly Place, shall have an approved system of automatic sprinklers conforming with Section 901 over the stage, in toilet rooms, lounges, smoking rooms, and all other parts including basements, cellars, property rooms, dressing rooms, storerooms, workshops, and all portions of stage and rooms under the stage floor level except as noted below.

Sprinklers shall not be placed in the auditorium, foyers, lobbies, or over dynamos or switchboards without proper protection, or in the immediate vicinity of automatic stage ventilators.

512.24 — STANDPIPES

In Group E, Assembly occupancies, a standpipe outlet with hose attachments shall be provided on each side of the rear of the place of assembly, on each side of the rear of each balcony and gallery, on each side of the stage, on each tier of dressing rooms, and within 50 feet of all property rooms, storerooms and workrooms. Such outlets shall connect with a standpipe which shall conform to the requirements of Section 902.1, but which shall have a diameter of not less than 4 inches except that standpipes on each side of the stage shall be of diameter not less than 2½ inches.

512.25 — MOTION PICTURE PROJECTION BOOTHS

Every motion picture projector using flammable films, together with all electrical devices, rheostats, and other film equipment, and all films shall be enclosed in a booth constructed as specified herein.

The floor of such booths shall be of masonry or concrete not less than 2 inches thick, and the walls and ceiling shall be of non-combustible construction providing not less than 1-hour fire resistance with all joints sufficiently tight to prevent the discharge of smoke.

The size of the projection booth shall depend upon the equipment and apparatus to be placed therein. In general, there shall be at least 30 inches of clear space to the right and rear of each projector with ample space about spot lights and other devices for normal operation. For a single projector without sound equipment, the booth shall in no case be less than 8 feet wide, 10 feet deep and 8 feet high; where two projectors with sound equipment are used, the minimum size of booth shall be increased to 16 feet wide and 12 feet deep.

Storage batteries shall be located in a separate compartment provided with an acid-resisting, metal ventilating duct leading to outdoors. Motor generators shall also be located in a separate compartment. These compartments shall be of construction as specified for projection booths.

The projection enclosure or booth shall have not less than two exit doors each not less than 30 inches or more than 32 inches wide and 6 to 7 feet high, protected by approved self-closing fire doors. Top of openings shall be at least 1 foot below booth ceiling.

Openings for projectors shall be no larger than necessary, and for the projectionist's view shall in no case exceed 10 inches in any dimension. Such openings shall be provided with automatic metal shutters and shall conform to the Regulations of the National Board of Fire Underwriters for Nitrocellulose Motion Picture Films, Pamphlet No. 40 dated July 1, 1939.

All shelves, racks, furniture, and fixtures within the booth shall be of metal or non-combustible material. No combustible material shall be allowed within the booth except the films and cement used in the operation of the machine. Every motion picture machine shall be securely fastened to the floor.

Metal cabinets or boxes with tight self-closing doors, each with a capacity not in excess of 10 reels of film, with individual compartments for each reel, shall be provided to store films not in use; no solder shall be used in the construction of such cabinets and boxes.

Ventilation shall be provided by one or more mechanical exhaust systems which shall draw air from each arc lamp housing and from one or more points near the ceiling. Systems shall exhaust to outdoors either directly or through a non-combustible flue used for no other purpose. Exhaust capacity shall be not less than 15 cubic feet nor more than 50 cubic feet per minute for each arc lamp, plus 200 cubic feet per minute for the room itself. For a booth containing two projectors, the exhaust flue shall be not less than 18 inches in diameter or equivalent size. Systems shall be controlled from within the enclosure and have pilot lights to indicate operation. The exhaust system serving the projection room may be extended to cover rooms associated therewith, such as rewind rooms. No dampers shall be installed in such exhaust systems. Ventilation of these rooms shall not be connected in any way with ventilating or air conditioning systems serving other portions of the building.

Exhaust ducts shall be of non-combustible material, and shall either be kept 1 inch from combustible material or covered with ½ inch of approved, non-combustible, heat insulating material.

Fresh air intakes other than those direct to the open air shall be protected by approved fire shutters arranged to operate automatically with the port shutters.

Provisions shall be made so that the auditorium lights can be turned on from inside the projection booth and from at least one other convenient point in the building.

512.26 — REWINDING OF FILM

All rewinding of film shall be done either in a projection booth, or in a room enclosure constructed to meet the fire resistance requirements prescribed for film projection booths. If done in projection room, approved enclosed type rewind machines shall be used and an approved can with self-enclosing hinged cover shall be provided for scrap film.

512.27 — SUPPLEMENTARY LIGHTING SYSTEM

There shall be installed in every Group E-1, Large Assembly Places, a supplementary lighting system, in addition to the regular system furnished by local electrical power; such supplementary system shall comprise storage batteries, or equivalent emergency systems, of sufficient power to augment the regular lighting system, in case of failure in emergency. There shall be two switches provided for the purpose of turning on such supplementary lighting system, one switch located in the projection booth and one located and properly protected on the outside of the building; all such turn on switches shall be plainly marked as such. Every supplementary lighting system shall be maintained in good working order and shall be tested at least once every ten days.

SECTION 513—BOWLING ALLEYS

513.1—GENERAL

Bowling alleys shall have at least two separate exits and shall comply with the exit requirements specified in Section 512.8.

Where bowling pin finishing or refinishing operations are carried on, such a separate building, or a separate room, constructed as specified herein, shall be provided.

Such a room shall be located at or above street level and shall have one or more windows opening to the outside of the building.

Walls and ceiling of such rooms shall be of not less than one-hour fire resistive construction. Floors shall be of concrete at least two inches thick or of equivalent non-combustible protective material.

Door openings shall be provided with non-combustible sills, raised six inches above floor level and protected with approved fire doors.

513.2—PIN FINISHING ROOMS

Shelving, containers, and all furnishings shall be of non-combustible material. Machinery shall be effectively grounded. (See Sec-

tion 501.1 (f).)

Ventilation sufficient to effect complete change of air at least once every three minutes shall be provided.

SECTION 514—CHURCHES

514.1—SCOPE

This section shall apply to churches or places of worship. All other places of public assembly shall be governed by the regulations as set forth in Section 512.

514.2—TYPES OF CONSTRUCTION

Churches of Group E-1 large assembly shall be of Type I or II construction. Churches in Group E-2 small assembly shall be of Type I, II, III, IV, V, or VI constructions and shall come within the limitations of use prescribed in Section 408.6.

514.3—INTERIOR FINISH AND DECORATIONS

All interior finishes and decorations shall conform with Section 512.2 except that nothing in this Section shall prevent the use of wood for ornamental purposes, trusses, paneling or chancel furnishing.

514.4—MAIN ENTRANCE DOORWAYS

In no case shall the minimum aggregate width of the main entrance doorways be less than six feet, with an increase of 20 inches for each 100 persons over 300. Main entrance doorways shall be in addition to the required emergency exit doorways as set forth in Section 514.5.

514.5—EXITS, GENERAL

Exit openings shall be in addition to main entrances. Exits shall open directly upon a street, exit courts or public space. No corridor shall be less in width than the largest door opening into it, plus one-half the sum of the widths of all other doorways. There shall be no openings other than exits in such corridors.

GROUP E-1—LARGE ASSEMBLY

No Group E-1 large assembly church shall have less than three exitways on the main floor except where more than 1,000 people are accommodated in which case there shall be not less than four exitways. Exitways shall be so located that the maximum distance of travel to any exitway shall be not more than one hundred feet and they shall be located as remotely as possible from one another. Where a balcony is provided there shall be not less than two exitways.

GROUP E-2—SMALL ASSEMBLY

In every Group E-2 small assembly church there shall be not less than two exits, serving the main floor and a like number serving the balcony located as remotely as practicable from one another. In no case shall the maximum distance of travel to an exit be greater than one hundred feet.

514.6—AGGREGATE CLEAR WIDTH OF EXITWAYS

The aggregate clear width of all exitways shall be not less than 22 inches for each one hundred persons expected to occupy such building; except that in no case shall an exit be less in width than the full width of the aisle or aisles leading thereto.

514.7—EXIT DOORWAYS

Group E-1—Every exit doorway shall have minimum clear width of not less than five feet nor in any case less in clear width than the exit or exitway it serves.

Group E-2—Every exit doorway shall have minimum clear width of not less than three feet nor in any case less in clear width than the exit or exitway it serves.

Exit doorways shall open outward and in no case shall any doorway be hung so as to decrease the required width of a passageway.

514.8—AISLES AND SEATING

Every aisle shall lead to an exit door or to a cross aisle running parallel to the seats and leading directly to an exit. No aisle shall be less in width than 36 inches plus an increase of 1½ inches for each five feet of such aisle from its beginning to an exit, except that aisles with seats on one side may be six inches less in width; where egress is provided at both ends of an aisle, the aisle may have a uniform width of not less than specified herein. No cross aisle shall be less than 3 feet 6 inches. An aisle bordering on a means of entrance shall be not less than 4 feet wide.

There shall be no obstructions of any kind in an aisle. Aisles shall not exceed a gradient of more than one in eight. No steps shall be used in any aisle where differences of level can be overcome by gradients. Where it is necessary in balconies to use steps, they shall extend the full width of aisles and risers shall not exceed six and one-half inches.

Rows of seats between aisles shall have not more than 20 seats. Rows of seats OPENING onto an aisle at one end shall have not more than 7 seats. Seats without dividing arms shall have their capacity determined by allowing 18 inches per person.

The spacing of rows of seats from back to back shall be not less than 30 inches. In every case there shall be a clear space of not less than 12 inches between the back of one seat and the front of one seat immediately behind it, measured at the seat line.

514.9—STAIR CONSTRUCTION

The construction of Stairways shall conform to the requirements of Section 1108.

CHAPTER VI

CLASSIFICATION OF BUILDINGS BY CONSTRUCTION

SECTION 601—CLASSIFICATION BY TYPE OF CONSTRUCTION

601.1 — TYPES

All buildings shall be classified into six general types according to the character of materials employed and their method of assembly, as follows:

TYPE I — FIREPROOF

TYPE II — FIRE-RESISTIVE

TYPE III — HEAVY TIMBER

TYPE IV — NON-COMBUSTIBLE FRAME

TYPE V — ORDINARY

TYPE VI — WOOD FRAME

601.2 — FIRE-RESISTIVE REQUIREMENTS

All fire-resistive requirements are expressed in terms of the number of hours of satisfactory performance in accordance with the "Standard Methods of Fire Tests of Building Construction and Materials of the American Society for Testing Materials". (ASTM Designation E119-47).

601.3 — MATERIALS AND CONSTRUCTIONS APPROVED FOR FIRE PROTECTION

The degree of fire resistance and the materials, assemblies, and constructions providing such resistance shall be as defined in Chapter X of this Code, except that other materials, assemblies, and constructions shall be approved, provided test data of a recognized engineering or testing laboratory are submitted, establishing that they develop the required fire-resistance ratings under tests made in accordance with the Standard Methods of Fire Tests of Building Construction and Materials, (ASTM Designation E119-47 of the American Society for Testing Materials).

Where structural requirements necessitate assemblies providing greater fire resistance than specified in this Chapter, such structural requirements shall govern.

SECTION 602—TYPE I—FIREPROOF CONSTRUCTION

602.1 — GENERAL

Type I, Fireproof construction, is that in which all exterior walls are of masonry or reinforced concrete, or of other approved materials or combination of materials, and in which all the structural members are of non-combustible materials, and provide Fire-Resistance not less than specified in this Section.

602.2 — FIRE DISTRICTS — SECTION 301

602.3 — ALLOWABLE HEIGHT — SECTIONS 404 to 411, inclusive

602.4 — ALLOWABLE AREA—SECTIONS 404 to 411, inclusive

SECTION 604—TYPE III—HEAVY TIMBER

CONSTRUCTION

604.1—GENERAL

Type III—Heavy Timber construction is that in which all exterior walls are of masonry or reinforced concrete, or of other approved materials or combinations of materials that provide fire resistance not less than required in this Section, and in which all the structural members are of heavy timber, of sizes not less than indicated in this Section, or are in part of protected steel or reinforced concrete of fire resistance not less than required in Table 604.5. There shall be no concealed spaces within the combustible member of heavy timber construction; such spaces may occur only within the required protection of incombustible members.

Deck Construction		See Note (2)
ROOFS See Note (3)		
Deck Construction High above Floor	*	See Note (3)

NOTE: *For buildings of Group C and E (School and Assembly) occupancies where steel structural members supporting a roof only and are twenty (20) feet or more clear above any floor or balcony, non-combustible construction unprotected may be used.

In all Group D (Institutional); and in Group C (Schools) two or more stories in height; at least one-hour interior fire-resistant construction shall be used throughout.

Note (1) All exterior walls within fifty (50) feet of adjacent property lines and all walls within fifty (50) feet of other buildings shall be provided with a parapet wall at least three (3) feet high above the roof except that parapet walls need not be constructed on buildings where the roof slopes more than four (4) inches vertical to twelve (12) inches horizontal from the back of the exterior wall of such building. Parapets at least three (3) feet high above the roof shall be provided on all fire walls and party walls regardless of roof slope.

Note (2) Wood floors shall be of at least three (3) inch nominal thickness splined or tongue and grooved planks or four (4) inch old laminated planking laid on edge, with a top layer of floor-

**TABLE 604.5 — FIRE PROTECTIVE REQUIREMENTS — TYPE III —
HEAVY TIMBER (Cont'd.)**

ing one (1) inch nominal thickness.

All timbers and planking shall be self-releasing at end support on walls. A space of at least one-half ($\frac{1}{2}$) inch between floor construction and wall shall be provided to allow for swelling; such space shall be covered to prevent passage of heat or flame. Concealed air spaces in such construction shall not be permitted.

Other types of floors shall be of non-combustible construction providing not less than one (1) hour fire resistance.

Note (3) ROOF CONSTRUCTION—Roofs shall be as specified for floor construction except that minimum allowable thickness of wood plank roofs shall be not less than two (2) inches nominal and except that non-combustible construction may be used.

Attic spaces shall be divided into areas not exceeding two thousand five hundred (2,500) square feet by non-combustible partitions, unless roof and attic are of non-combustible construction or unless an approved sprinkler system is installed in the attic space.

Note (4) TIMBER ARCHES AND TRUSSES—Timber arches or trusses may be used to support roof loads. The framing members shall be not less than four by six inches nominal dimensions, except that spaced members may be composed of two or more pieces not less than three inches nominal in thickness when blocked solidly throughout their intervening spaces or when such spaces are tightly closed by a continuous wood cover plate of not less than two inches nominal thickness secured to the underside of the members. Splice scabs shall not be less than three inches nominal thickness. When protected by approved automatic sprinklers under the roof deck, the framing members may be reduced to not less than three inches nominal thickness.

SECTION 605—TYPE IV—NON-COMBUSTIBLE

FRAME CONSTRUCTION

605.1 — GENERAL

Type IV, Non-Combustible Frame Construction, is that in which all structural members, including wall framing, floors, roofs and their supports, shall be of steel, iron or other metal, or of other non-combustible materials, and in which the exterior surface of the building is of steel, iron or other metal, or of asbestos, masonry, reinforced concrete, or other non-combustible materials, and that are fire-protected only where specified in this Section.

NOTE (1) Buildings of Type V Construction over one story in height, except one and two family dwellings, floors located immediately above usable spaces in basements or cellars and above furnaces shall have one hour fire protection except where basement or cellar is equipped with an approved automatic sprinkler system.

*In buildings over two (2) stories in height, (unless

**TABLE 606.5 — FIRE PROTECTIVE REQUIREMENTS — TYPE V —
ORDINARY (Cont'd.)**

sprinkled) all walls, partitions, floors and their supporting structural members shall provide not less than one (1) hour fire resistance within the building and the ceiling underneath the roof shall be the same as required for the floors.

In all Group D (Institutional) occupancies; and in Group C (Schools) two or more stories in height; at least one (1) hour interior fire-resistive construction shall be used throughout.

****This requirement applies only to structural members supporting masonry walls except that this does not apply in one story buildings or where the only masonry supported is a masonry veneer.**

- c. For other occupancies, See Section 704.

SECTION 607—TYPE VI—WOOD FRAME CONSTRUCTION

607.1—GENERAL

Type VI—Wood Frame Construction—is that in which the enclosing walls are of wood or other combustible materials, including construction having exterior masonry veneer, stucco, or metal which is dependent upon wood for support, stability or rigidity, and in which interior framing is of wood or other combustible materials.

607.2—LOCATION ON PROPERTY

All exterior walls of Type VI, Wood Frame buildings located less than three (3) feet from property lines shall provide not less than one hour fire-resistive protection.

607.3—BUILDINGS LOCATED ON THE SAME LOT

Where two or more buildings of Type VI construction are on the same lot, there shall be a clear space of not less than six (6) feet between the buildings unless one of the exposed walls has at least one hour fire resistance.

607.4—FIRE DISTRICTS

Type VI—Wood Frame Construction—is prohibited in Fire Districts No. 1 and No. 2, except as provided for in Section 304.2.

607.5—ALLOWABLE HEIGHT—SECTIONS 404 to 411, inclusive

607.6—ALLOWABLE AREA—SECTIONS 404 to 411, inclusive

SECTION 608—EXCEPTIONS TO FIRE PROTECTION

608.1—ELEVATOR FRAMES

Structural members of frames for elevators will not be required to have the fire protection required for structural steel, provided such members are erected within an enclosure of the prescribed fire-resistance rating. Section 701—Enclosure of Vertical Openings).

608.2.—LINTELS

Lintels over openings in walls shall be protected to provide a fire resistance rating at least equal to that required for beams, except that when such lintels are used over openings less than four (4) feet wide, such protection may be omitted. The outer member of an assembled steel lintel which supports face masonry that is securely bonded to backing need not be protected, provided that the load carrying member of such lintel is protected as herein required.

SECTION 609 — MIXED TYPES OF CONSTRUCTION

609.1

When two or more types of construction occur in the same building and are not separated by the fire separation specified in Section 412 for Mixed Occupancies, the entire building shall be subject to the occupancy restrictions of the least fire resistive type.

609.2

Where a building is constructed of more than one type of construction, the following limitations shall be observed:

TYPE I construction shall not be supported by any other type.

TYPE II construction shall not be supported by construction other than Type I or Type II.

TYPE III construction shall not be supported by construction other than Type I, Type II or Type III.

TYPE IV construction shall not be supported by Type V, or Type VI.

TYPE V construction shall not be supported by Type VI.

CHAPTER VII

FIRE PROTECTION REQUIREMENTS

SECTION 701

PROTECTION OF VERTICAL OPENINGS, STAIRS AND ELEVATORS

701.1 — GENERAL REQUIREMENTS FOR ENCLOSURE OF VERTICAL OPENINGS OR SHAFTS

Every series of openings in floors or roofs, except one and two family dwellings, shall be enclosed to prevent spread of fire from story to story, as herein specified, unless otherwise specifically provided in this code.

In buildings more than two (2) stories in height, other than one and two family dwellings, all vertical shafts extending through more than one story shall be enclosed in all stories with partitions of not less than 2-hour fire-resistive construction, unless otherwise prescribed in Sections 701.2, 701.3 and 701.4. In Group A, Residential buildings not over three (3) stories in height, such partitions shall provide at least 1-hour fire resistance. A shaft that does not extend through the roof shall have its top enclosed with construction having fire-resistance at least equal to that of the enclosing walls.

For bearing partition requirements see types of construction, Chapter VI.

Parapet walls at least thirty-six (36) inches in height above the roof shall be provided around all open shaft enclosures that extend through a roof except that where roof is of non-combustible construction a half rail at least thirty (30) inches high may be used around openings instead of a wall.

All shaftway enclosures extending above the roof of a building, except those open at the top, shall have a skylight with metal frame glazed with plain glass and with protective wire mesh screen below, conforming with Section 707; such skylight shall have an area equal to at least seventy five (75) per cent of the area of the shaftway at the top story, or other equivalent ventilation shall be provided. A window of plain glass of equivalent area, located in the side of the shaft may be used instead of a skylight provided it has its sill not less than two (2) feet above the roof and does not face a property line within ten (10) feet.

In every building where the enclosing walls or shafts are open to the outer air at the top, they shall be constructed to provide fire resistance equivalent to that specified in Chapter VI, for the inner court walls of such a building.

Openings in all shaft enclosures shall be limited to those absolute-

ly necessary for the purposes of the shaft and shall be protected with approved fire doors, fire shutters, or fire windows (see Section 703.6).

701.2 — STAIRWAY AND EXIT ENCLOSURES

In all buildings, four (4) stories or more in height, except one and two family dwellings, and except in those occupied by forty (40) people or less above or below the story at street level, all interior stairways including platforms, landings and hallways connecting them to the doorway leading to the outside, shall be completely enclosed with partitions of not less than 2-hour fire-resistive construction. Structural members supporting all such enclosing walls and partitions, and floors or roofs that form a part of the enclosure, shall have at least 2-hour fire resistance also.

In all buildings, two (2) or three (3) stories in height excepting one or two family dwellings, all required interior stairways shall be enclosed in partitions of at least 1-hour fire resistance.

For stair enclosure requirements governing Group E assembly occupancies, see Section 512.3.

No enclosure shall be required for a flight of "monumental" stairs (as used in public buildings, stores, hotels, office buildings, etc.) from the main street entrance floor to the floor next above (or to the basement) when such stairs are not a part of the required exit facilities, or for such stairs leading to a mezzanine or balcony from the main floor.

Stairways in buildings of Group G, Industrial occupancies, that are not required for exits and that serve only one floor above the first floor may not be required to be enclosed, provided the occupancy of the building is of low fire hazard and provided the omission of such stair enclosure is approved by the Building Official.

Basement or cellar stairs: Except in one and two family dwellings, basement or cellar stairways located under stairways from upper stories shall be completely enclosed by construction providing fire resistance not less than required for the stair enclosure above the basement but in no case less than 1-hour fire resistance.

No openings shall be permitted in a stairway enclosure except as permitted in Section 703.6.

For general requirements see Section 701.1.

701.3 — ELEVATOR ENCLOSURES

Not more than three (3) elevators shall be placed in one shaft and such shaft enclosure shall have at least 2-hour fire resistance, except that in residential buildings of Group A, or any Group B building, not over three (3) stories in height, enclosures may be of construction having 1-hour fire resistance.

In shaftways for elevators there shall be at least one (1) door in every thirty (30) feet of height. All openings shall be protected as required in Section 703.6.

Elevators counted as exits shall not be in a common enclosing

shaft with a stairway, and the path of travel from one flight of stairs to the next shall not pass directly in front of elevator doors.

An elevator shaft that does not extend to the bottom of a building shall be enclosed at its lower point to provide fire resistance not less than that required for the lowest floor through which the elevator passes, but in no case less than is required for Type II construction.

The compartment that contains machinery for operating an elevator shall be separated from the elevator shaft by Type I, Fireproof, or Type II, Fire Resistive construction, and shall be enclosed with partitions having at least 2-hour fire resistance and all openings shall be equipped with approved fire doors.

For general requirements see Section 701.1.

701.4 — ESCALATOR ENCLOSURES

The same requirements shall apply to escalator enclosures as apply to stairway enclosures; (see Section 701.2), except that in Type I, Fireproof, or Type II, Fire Resistive construction, the escalator opening need only be enclosed by fire resistive partitions at the upper floor level served, provided such escalator is not used as a required means of exit.

SECTION 702—PARTITIONS

702.1 — GENERAL

This section shall apply to partition requirements for the various occupancies and types of construction. Fire resistive ratings shall conform to provisions of Chapter X. Height and thickness of Masonry Partitions shall not be less than specified in Section 1406.

Non-bearing masonry partitions shall be built solidly against the floor and ceiling construction below and above.

Solid or hollow non-bearing partitions of plaster continuously reinforced with metal or gypsum lath applied over vertical steel or iron studs or solid, studless gypsum or metal lath and plaster partitions shall be anchored or firmly attached to metal track which is suitably anchored to floor and ceiling construction. Such solid reinforced plaster partitions shall have a minimum thickness of not less than two (2) inches and their minimum out-to-out thickness shall be governed by their unsupported heights.

For hollow partitions of metal lath and plaster construction, the thickness of plaster of each side shall be not less than three-quarters (¾) inch, with not less than one (1) inch separation.

For the fire resistance ratings of partitions, see Section 1002.

702.2 — PARTITION REQUIREMENTS

All non-bearing partitions shall conform to these fire-resistive requirements, except as otherwise specified. See interior finish requirements of Section 704.

TYPE I—FIREPROOF—Partitions, except as modified in this section, shall be of non-combustible material and of not less than one-hour fire-resistive construction.

TYPE II—FIRE-RESISTIVE—Partitions, except as modified in this section, shall be of non-combustible material.

TYPE III—HEAVY TIMBER—Partitions shall be of one hour fire-resistive construction or may be of wood construction formed of two (2) layers of one (1) inch nominal matched boards, or of solid wood laminated construction not less than three and five-eighths (3 5/8) inches thick.

TYPE IV—NON-COMBUSTIBLE AND

TYPE V—ORDINARY—In buildings over two (2) stories in height, unless sprinklered, if located within the First Fire District, all permanent partitions shall be of not less than one-hour fire-resistive construction.

GROUP A—RESIDENTIAL—All partitions, except one and two family dwellings, along public hallways or partitions that separate apartments, or that separate apartments from other occupancies, shall be of not less than one hour fire-resistive construction.

GROUP B—BUSINESS BUILDINGS—In buildings more than one story in height, partitions along public hallways shall be of one-hour fire resistive construction.

Regardless of type of construction, temporary non-fire-resistive partitions may be constructed up to three-fourths the height of a room in which placed. If such partition is more than three-fourths the height of the room, the upper one-fourth of the partition shall be constructed of plain glass set in sash. All such non-fire-resistive partitions shall be used only within rooms or spaces not exceeding five thousand (5,000) square feet; provided such room or space be enclosed within partitions of not less than one-hour fire resistive construction. When the first floor is arranged so it is to be occupied by more than one tenant, the area occupied by each tenant shall be separated from adjacent tenants by a partition of not less than one-hour fire resistive construction (see Section 412 for mixed occupancy separations).

GROUP C—SCHOOLS—Partitions in buildings two or more stories in height shall be of not less than one hour fire-resistive construction. All partitions, for school buildings two (2) stories or less in height, shall be protected with plaster or other non-combustible material except for rooms in one story buildings having direct exit to the outside.

GROUP D—INSTITUTIONAL—All partitions shall be of not less than one hour fire-resistive construction.

GROUP E—THEATERS AND PUBLIC ASSEMBLY—See Section 512.3 for partition requirements.

GROUP F—STORAGE

GROUP G—INDUSTRIAL and

GROUP H—SPECIAL OCCUPANCIES—Partitions in Group F and Group G buildings over three (3) stories, and all partitions in Group H buildings shall be of not less than one hour fire-resistive construction, except where greater fire-resistance is required. Combustible partitions may be used within accessory offices and rooms necessary for transacting the principal business of such occupancies, provided that such rooms are used for non-hazardous purposes.

SECTION 703—PROTECTION OF WALL OPENINGS

703.1 (a) — WHERE PROTECTION IS REQUIRED

For the purpose of this section, when a building is divided by fire walls into two or more sections, each section shall be regarded as a separate building.

Every building (except one and two family dwellings which are less than three (3) stories in height, churches, and buildings of Type VI, Wood Frame construction) shall have approved fire windows, fire doors or other approved protectives, in every opening in the exterior walls under the following conditions:

1. In buildings three (3) stories or more in height where the distance is fifteen (15) feet or less from the property line. For buildings less than three (3) stories in height, protection shall be required only where the distance is eight (8) feet or less from the property line.

2. In buildings where such opening is above and less than fifteen (15) feet distance from any part of a neighboring roof.

Exceptions: Such protection shall not be required for show windows facing on a street or public place which do not extend above the second full story above grade nor shall such protection be required when the opening to be protected and the opening against which it is to be protected are facing in the same direction being located in walls in the same or parallel lines. All required opening protection shall be of approved type as defined elsewhere in this section.

703.1 (b) — EXTERIOR WALLS WITHOUT WINDOW OPENINGS

In buildings having exterior walls of length over three hundred (300) feet without openings, access panels at street or grade level shall be provided, spaced not over two hundred (200) feet apart, to permit access to the building by firemen in the event of fire.

Access panels shall also be provided as directed by the Building Official, where openings in exterior walls on street fronts are either

lacking or are insufficient to provide ready access by firemen.

Such access openings shall be provided with approved fire protection where required under the conditions specified in this section.

703.2 (a) — APPROVED TYPES OF FIRE WINDOWS, FIRE DOORS, AND FIRE SHUTTERS

Fire windows shall be deemed approved if they comply with the specifications given in this section, and fire doors and fire shutters shall be deemed approved if satisfactory evidence is given that they have successfully passed a fire test as specified in this Section, conducted by an accredited laboratory provided a test certificate is filed with the Building Official from such accredited laboratory.

Fire doors, fire windows, and fire shutters enumerated in the "List of Inspected Fire Protection Equipment and Materials" of Underwriters Laboratories, Inc. as suitable for given locations and conditions, shall be deemed to be approved within the meaning of this code. They shall be installed in accordance with the recommendations of the National Board of Fire Underwriters for the "Protection of Openings in Walls and Partitions Against Fire."

703.2 (b) — FIRE TESTS OF PROTECTIVE DOOR OR SHUTTER ASSEMBLIES

Tests of opening protective assemblies shall be made upon complete full size assemblies, except that in any case the assembly need not exceed one hundred eight (108) Sq. Ft. in area, constructed and installed in all essentials as in actual service and subjected to a fire on one side continuously for periods in accordance with the time-temperature curve of the standard fire test specifications prescribed in Section 601 (ASTM "Standard Specifications for Fire Tests of Building Construction and Materials" (E119-47)).

Opening protective assemblies tested to establish a fire resistive rating (one hour or more) shall be subjected to a hose stream test conducted in accordance with the standard ASTM fire test specifications, "Fire Tests of Door Assemblies, C152-40T."

The duration of the fire test shall be as follows:

For fire doors required in 4 Hr. fire resistive walls or partitions	3 Hrs.
For fire doors required in 3 Hr. fire resistive walls or partitions	1½ Hrs.
For fire doors required in 2 Hr., or less, fire resistive walls	¾ Hrs.
For fire shutter assemblies	¾ Hrs.

When two fire door assemblies each of which has been accepted for a one and one-half (1½) hour fire resistive rating, are installed on two (2) sides of the same opening, such combined assembly shall be accepted as having a 3-hour fire resistive rating. Similarly, two door assemblies, each having a three-quarter (¾) hour rating, shall be accepted as having a one and one-half (1½) hour rating.

703.2 (c) — FIRE SHUTTERS

Tests of fire shutters to be successful shall meet the requirements

for fire doors except that no restriction shall be made as to the amount of heat transmitted through the shutters.

703.2 (d) — FIRE WINDOWS

Fire windows shall have a fire resistance rating of not less than three-quarters ($\frac{3}{4}$) of an hour, and shall have frame and sash of solid steel sections or of hollow metal forms fabricated by pressing, riveting, interlocking, welding or crimping together but not by the use of solder or other fusible alloy.

Wire glass not less than one-quarter ($\frac{1}{4}$) inch thick shall be used in all fire resistive windows. Size of individual glass lights shall not exceed seven hundred and twenty (720) Sq. In. of exposed area. Continuous glazing angles shall be provided on the inside of all fire windows, except such casement section sash, outside glazed, having wire clips, as have been approved by the Underwriters.

Maximum sizes of fire windows shall be as follows:

Hollow metal window frames shall be limited to a height not exceeding ten (10) Ft. and a maximum width of six (6) Ft. for double hung and for counterweighted type and for counterbalanced type; a maximum width of six (6) Ft. for fixed sash windows and of five (5) Ft. for all other types. Hollow metal mullions shall be used for non-bearing purposes only.

Solid section window frames shall be limited to a maximum size of eighty-four (84) Sq. Ft. with maximum dimension not exceeding twelve (12) Ft. except that solid section windows when used with the unprotected steel mullions shall be limited to seven (7) Ft. in width. Solid section mullions when used in lengths exceeding twelve (12) Ft. shall be fire protected to provide the same degree of fire resistance as is required for the wall construction of the building in which they are placed.

Types of sash not specifically covered in this Section of the code shall not exceed the maximum size, glass area, etc., specified in the "List of Inspected Fire Protection Equipment and Materials" of Underwriters' Laboratories, Inc.

703.3 — VERTICAL SEPARATION OF OPENINGS

Exterior openings in a building, that are located vertically above one another and which are not protected by approved types of fire windows or fire doors shall have a space of not less than three (3) Ft. between the top of one opening and the bottom of the next above, or such openings above the lowest shall be protected against fire by an approved protective device. Such wall space shall be constructed of materials having fire resistance meeting the requirements for the exterior walls of the type of construction used for such building, as prescribed in Chapter VI of this code.

703.4 — PROTECTION OF DOOR OPENINGS IN WALLS AND PARTITIONS

Wherever protection of door openings is required by this code

and in all walls and partitions which are required to be of 2-hour or more fire resistive construction, door openings shall be protected with approved fire doors meeting the requirements of Section 703.2. In addition, wherever deemed necessary by the Building Official, approved fire doors may be required for the protection of exits or of adjoining property.

In 4-hour and 3-hour fire resistive walls or partitions, no opening shall exceed one hundred twenty (120) Sq. Ft. in area with no dimension greater than twelve (12) Ft., and the aggregate width of all openings at any level shall not exceed twenty-five percent of the length of such wall or partition. Every door opening in such wall or partition shall be protected on each side with an approved automatic fire door; provided that when such wall or partition serves also as a horizontal exit, it shall have no openings other than door openings not exceeding forty-eight (48) Sq. Ft. in area, and one of the automatic fire doors at each opening shall be replaced by a self-closing fire door.

In 2-hour fire-resistive walls or partitions, no single door opening shall exceed one hundred eighty (180) Sq. Ft. in area. The aggregate width of all openings in such walls or partitions at any level shall not exceed that permitted for three-hour walls. Every door opening shall be protected with an approved automatic or self-closing fire door, provided that when such wall serves also as a horizontal exit, no opening shall exceed forty eight (48) Sq. Ft. in area and protection shall be provided by an approved self-closing fire door.

In 1-hour fire resistive walls or partitions, unless otherwise specified, all door openings shall be protected with approved metal or metal covered doors or wooden doors of the solid core flush type of nominal thickness of at least one and three quarter (1 $\frac{3}{4}$) inch in all parts.

See Section 703.2 for fire resistance requirements of fire doors.

When proof satisfactory to the Building Official is furnished that a larger size of opening than prescribed herein is necessary, the area may be increased if such opening is provided with protective devices that meet the approval of the Building Official.

703.5 — FIRE SHUTTERS

When equipped with fire shutters of the swinging type, at least one in every three openings facing a street in each story shall have such shutters arranged to be readily opened from the outside. Distinguishing marks shall be provided on these shutters.

Fire shutters of the rolling type shall be carefully counterbalanced and so arranged that they can be readily opened from the outside.

703.6 — OPENINGS IN STAIRWAYS OR SHAFTWAYS

Shaft walls or enclosures of vertical openings shall have no openings other than such as are necessary for the purpose of the shaftway; all openings in shafts shall be protected with approved fire doors, approved fire shutters or approved fire windows.

Swinging doors only shall be used in connection with required stair exits and such doors shall swing in the direction of exit travel but shall not reduce the required width of exit.

In stair enclosure walls or partitions protecting the stair from the interior of the building, no openings except the necessary doorways shall be permitted. (This shall not, however, prohibit the use of fire windows of approved type, in stair enclosures provided they open to the exterior of the building and are located at least ten (10) feet from any other wall opening.) Such doorways shall be equipped with approved self-closing fire doors, except that when enclosing partitions are not required to provide over 1-hour fire resistance, approved self-closing metal or metal-covered doors or solid core wooden doors of the flush type of nominal thickness of at least one and three quarters (1¾) inch in all parts, may be used.

All openings located within 10 feet of exterior stairways or fire escapes shall be protected with approved self-closing fire doors or approved fire windows, except where the door serves such exitway.

703.7 — OPENINGS IN MIXED OCCUPANCY SEPARATIONS

See Section 703.4 for requirements governing door openings in walls and partitions required to be of fire resistive construction.

SECTION 704

RESTRICTIONS ON INTERIOR USE OF COMBUSTIBLE MATERIALS

704.1 — GENERAL

Combustible materials may be used for ceilings, floor finish or other interior finish of buildings as provided in this Section. Show windows in the first story of buildings may be of wood or of unprotected metal framing.

704.2 — FLOOR FINISH

In buildings of Type I, Fireproof construction or of Type II, Fire Resistive construction, floor finish, if of combustible material, shall be applied directly upon the floor construction except that a floor finish of wood, linoleum, rubber, tile or cork may be secured to a subfloor of wood. Where wood sleepers are used for laying wood floors in such buildings, the space between the floor slab and the underside of the finished floor shall be filled solidly with non-combustible material so there will be no open spaces under the flooring exceeding one hundred (100) Sq. Ft. and so there will be no open space extending under any permanent partition.

704.3 — CEILINGS AND INTERIOR WALL FINISH*

In every building except Type VI, wood frame construction, and one and two family dwellings, combustible materials for ceiling and for interior finish of side walls and partitions shall be of a type which will not have a rate of flame spread in excess of that of wood or fiberboard and will not develop gases more toxic or noxious than

wood or fiberboard when exposed to heat or flame. Such materials when applied to an incombustible base shall be installed in an approved manner.

The use of a surface finish of paper or of material of no greater fire hazard than paper shall not be prohibited provided such finish does not exceed 0.025 of an inch in thickness, and is applied directly to an incombustible base.

Materials used for ceilings and interior wall finish in Type I and Type II buildings over three stories in height shall be non-combustible except that this shall not prohibit the use of wood trim for door and window cases, chair rails, picture mouldings, base boards, wall paneling and the like, provided such wood work is backed solidly by non-combustible material. Fiberboard wall and ceiling finish may be used if applied to a non-combustible base or to furring strips, not exceeding one inch nominal thickness, applied over a non-combustible base with all spaces in back of the fiberboard in excess of eight square feet in area filled with a non-combustible material.

*For interior finish and decoration for Group E, Assembly Occupancy, see Section 512.2.

SECTION 705—FIRESTOPPING

Firestopping shall be provided in all walls and partitions to cut off all concealed draft openings both horizontal and vertical, and to form an effectual fire barrier between stories and between the upper story and the roof space.

Walls, including masonry walls furred with combustible material, and stud partitions shall be effectively firestopped with non-combustible material at floors, ceilings and roofs, except that in buildings of wood frame construction, firestopping may be of wood not less than two (2) inches in nominal thickness. (See Section 1702.6)

All openings around exposed pipes or power shafting shall be filled with approved non-combustible material, or shall be closed off by close-fitting metal caps at the ceiling and floor line, and on each side of a wall or partition.

All openings for belts and conveyors shall be provided with approved slotted doors, or be otherwise closed off. Belts shall not pass through fire-walls.

No firestopping shall be covered or concealed until inspected by the Building Official.

In combustible roof construction, where ceilings or concealed spaces occur, such spaces shall be divided into horizontal areas of not more than three thousand (3,000) square feet with tight partitions of non-combustible material or of approved wood construction consisting of one and one-half inch exterior plywood or of not less than two thicknesses of one (1) inch nominal lumber with joints broken.

All openings through these partitions shall be protected by self-closing doors of approved construction meeting the partition require-

ments.

Except in 1 and 2-family dwellings, when stairs are of wood or of combustible construction, the space between stair stringers shall be firestopped at top and bottom and at least once in the middle of each run, and firestopping shall also be provided between studs, along and in line with run of stair adjoining such partition.

Floors and roof constructed of combustible materials shall be firestopped at walls and partitions where openings occur. When wood joists run parallel to a wall, the space between the wall and the nearest joist shall be not less than two and one-half (2-½) inches and shall be solidly filled with non-combustible material.

Joists in all types of construction shall be firestopped at the ends and over supports for the full depth of the joists.

Spaces between chimneys and wood framing shall be solidly firestopped with mortar, concrete, or other non-combustible material. (See Section 1702.6)

In firestopping, any of the following materials may be used: brick, concrete, gypsum, steel, iron, asbestos, metal lath and cement or gypsum plaster, mineral wool, rock wool, or other approved non-combustible materials, securely fastened in place to cut off drafts and provide an effective fire stop.

SECTION 706—ROOF COVERINGS

706.1 — GENERAL

Roof coverings shall be divided into the classes defined below, whose use within Fire Districts shall be governed by the requirements of Section 301.2.

706.2 — CLASS 1 ROOF COVERINGS

Class 1 roof coverings shall be of brick, concrete, slate, tile, steel, slag, or any other material or form of protective covering approved by the Building Official after satisfactory evidence that it is effective against severe fire exposures. Under such exposure, Class 1 roof coverings shall not be readily flammable; shall not carry or communicate fire; shall afford a fairly high degree of heat insulation to the roof deck; shall not slip from position; shall possess no flying brand hazard; and shall not require frequent repairs in order to maintain their fire-resisting properties.

Roof coverings which are classified as Class A under the test specifications of Underwriters' Laboratories, Inc., shall be accepted as meeting the requirements of this Section.

706.3 — CLASS 2 ROOF COVERINGS

Class 2 roof coverings shall be of fire resistive material that is effective against moderate fire exposures. Under such exposures, Class 2 roof coverings shall not be readily flammable; shall not readily carry or communicate fire; shall afford a moderate degree of heat insulation to the roof deck; shall not slip from position; shall possess no flying brand hazard; and shall require only infrequent repairs to maintain their fire-resisting properties.

Roof coverings which are classified as Class B under the test specifications of Underwriters' Laboratories, Inc., shall be accepted as meeting the requirements of this Section.

706.4 — CLASS 3 ROOF COVERINGS

Class 3 roof coverings shall be of material that is effective against light fire exposures. Under such exposures, Class 3 roof coverings shall not be readily flammable; shall not readily carry or communicate fire; shall afford at least a slight degree of heat insulation to the roof deck; shall not slip from position; and shall possess no flying brand hazard; but may require occasional repairs or renewals in order to maintain fire-resisting properties.

Roof coverings which are classified as Class C under the test specifications of Underwriters' Laboratories, Inc., shall be accepted as meeting the requirements of this Section.

706.5 — REQUIREMENTS FOR ROOFS OUTSIDE FIRE DISTRICTS

Roofs on buildings outside of the Fire Districts, as established in Chapter III, may be of Class I, Class 2, or Class 3 roof coverings, as specified herein. Wood shingles shall not be used except as provided in this Section.

706.6 — WOOD SHINGLES

Outside the fire districts, dwellings and private garages, separated by at least twelve (12) feet from other buildings may be roofed with approved vertical grain or edge-grain wooden shingles. The combined thickness of each five (5) shingles measured at the butts shall be not less than two (2) inches. The exposure of such wooden shingles to the weather shall not exceed, on roofs greater than one-third pitch, five inches for 16-inch shingles, five and one-half inches for 18-inch shingles, and seven and one-half inches for 24-inch shingles; nor, on roofs with less than one-third pitch but not less than one-quarter pitch, four inches for 16-inch shingles, four and one-half inches for 18-inch shingles, and six and one-half inches for 24-inch shingles. Such shingles shall be firmly nailed to the roof with non-corrodible and rust-resistive nails according to accepted good practice. Unless otherwise specified by ordinance or duly promulgated rules, the Commercial Standard for Wood Shingles, CS 31-38 of the U. S. Department of Commerce, shall be accepted as means of establishing the grade of shingles.

SECTION 707—SKYLIGHTS

Except in Type VI, Wood Frame Buildings, the sashes and frames of all skylights hereafter placed on a building shall be constructed of steel, wrought iron, or other approved metal; except that in foundries or buildings where acid fumes which attack those metals, are present as an incident to the occupancy of such buildings, such sashes and frames may be constructed of wood if approved specifically by the Building Official.

Skylights shall be glazed with wire glass; except that skylights placed over shaftways, vent shafts, and stair enclosures shall be glazed with plain glass not over one-eighth ($\frac{1}{8}$) inch in thickness. No single pane of wire glass shall exceed seven hundred twenty (720) Sq. In. in area, or forty-eight (48) inches in any dimension.

Every skylight in which plain glass is used shall be protected by a substantial wire screen, having a mesh not less than three-quarter by three-quarter ($\frac{3}{4} \times \frac{3}{4}$) inch nor coarser than one by one (1 x 1) inch and made of wire not smaller than No. 12 B. and S. gauge, located at a distance not less than four (4) inches nor more than ten (10) inches above the glazed portion of such portion of such skylight at all points, and extending beyond such glazed portion on all sides, a distance not less than the height of the screen above the glass. A similar screen shall be placed below such skylight in such position as to serve as a protection from falling glass.

The above provisions shall not apply to skylights used in or as the roofs of greenhouses.

SECTION 708—MANSARD OR SLANTING ROOFS

Every mansard or other slanting roof having a pitch of more than sixty degrees (60 degrees) hereafter placed on any building over fifty (50) feet in height, shall be of non-combustible construction providing not less than 1-hour fire resistance, except that when such building exceeds eighty (80) feet in height, such roofs shall be of construction providing not less than 1- $\frac{1}{2}$ hour fire resistance.

SECTION 709—DORMER WINDOWS

Dormer windows hereafter erected shall be of the same type of construction as the roof on which they are placed, or of the side walls of the building. The top and sides shall be covered with roofing materials conforming with the requirements governing the roofing of the building.

SECTION 710—CORNICES, BALCONIES, BAY WINDOWS

All cornices, including those on show windows, hereafter placed on the exterior of buildings within the Fire Districts or on buildings over forty (40) feet in height located outside the Fire Districts shall be of non-combustible materials. The exterior of cornices on buildings forty (40) feet or less in height located outside of Fire Districts, except 1 and 2-family dwellings, and buildings of Type VI, Wood Frame construction, shall be of non-combustible material, or shall be covered with non-combustible material, when located within five (5) feet of lot line or of another building.

Continuous exterior cornices of wood, or on wood frames, shall be firestopped at intervals not exceeding twenty (20) feet.

Balconies, and bay windows, shall conform to the type of construction required for the building to which they are attached, except that all exterior balconies attached to, or supported by, walls of material other than wood, shall have brackets or beams of steel, concrete, or other non-combustible material.

SECTION 711—GUTTERS AND LEADERS

Gutters and leaders hereafter placed on buildings other than 1 or 2-family dwellings, private garages, or buildings of Type VI, Wood Frame construction, shall be of non-combustible material.

(See section 1407 for Parapet Wall relief opening requirements.)

SECTION 712—TOWERS, SPIRES, CUPOLAS, AERIAL SUPPORTS, POLES, ETC.

Any tower, spire, dome or cupola shall be of a type of construction not less in fire-resistance rating than required for the building to which it is attached except that any such tower, spire, dome or cupola which exceeds sixty (60) feet in height above grade, and all construction upon which it is supported, shall be of Type I, Fireproof; or Type II, Fire Resistive construction when the area at any horizontal section of such tower, spire, dome, or cupola exceeds two hundred (200) Sq. Ft. or when it is used for any purpose other than a belfry or an architectural embellishment.

Any tower, spire, dome or cupola which exceeds twenty-five (25) feet in height above the highest point at which it comes in contact with the roof or which exceeds two hundred (200) Sq. Ft. in area at any horizontal section or which is intended to be used for any purpose other than a belfry or architectural embellishment, shall be entirely constructed of and supported by non-combustible materials. Such structures shall be separated from the building below by construction having a fire-resistance rating of not less than 1-½ hours and, if access doors are provided, they shall be of approved fire-resistive type.

All structures, except aerial supports not over twelve (12) feet high, flag poles, water tanks and cooling towers, hereafter placed above the roof of any building within the Fire Districts, or above the roof of any building more than fifty (50) feet in height, wherever located, shall be of non-combustible material, and shall be supported by construction of non-combustible material.

SECTION 713—TANKS

Tanks of more than five hundred (500) gallons capacity hereafter placed in or on a building shall be supported on masonry, reinforced concrete or steel construction; provided that when such construction is within the building it shall be as required for Type I, Fireproof Construction.

Such tanks shall have in the bottom or on the side near the bottom, a pipe or outlet, fitted with a suitable quick opening valve for discharging the contents in an emergency through an adequate drain.

Such tanks shall not be placed over nor near a line of stairs or an elevator shaft, unless there is a solid roof or floor underneath the tank.

All unenclosed roof tanks shall have covers sloping toward the outer edges.

When hoops are used in the construction of tanks, they shall be of metal, and provision shall be made to guard against corrosion.

SECTION 714—COOLING TOWERS

Cooling towers in excess of two hundred fifty (250) Sq. Ft. in base area; or in excess of fifteen (15) feet in height when located on buildings inside the Fire Districts, or located on buildings outside the Fire Districts that are over fifty (50) feet in height, shall be of non-combustible construction except that drip boards may be of wood not less than one (1) inch nominal thickness and the enclosing frame work and framing may be of wood if covered on the exterior of the tower with incombustible material. Cooling towers shall not exceed forty (40) percent of the supporting roof area.

SECTION 715—DRYING ROOMS

Drying rooms or dry kilns located within a building shall be constructed entirely of non-combustible materials where used or intended to be used at temperatures exceeding one hundred twenty five degrees (125 degrees) fahrenheit; if enclosure is of metal, it shall be insulated from all or other such combustible material by not less than a twelve (12) inch air space, one-quarter ($\frac{1}{4}$) inch asbestos or other approved insulation.

All drying rooms shall have approved ventilation.

Heating pipes, not located overhead, shall be shielded to maintain not less than two (2) inch clearance between them and the contents.

CHAPTER VIII — HEATING

SECTION 801—GENERAL

801.1 — DEFINITIONS

CHIMNEY—A vertical masonry shaft of reinforced concrete, or other approved non-combustible, heat resisting material enclosing one or more flues, for the purpose of removing products of combustion from solid, liquid, or gas fuel.

FLUE—A vertical passageway for products of combustion.

SMOKE PIPE—A pipe or breeching connecting a heating appliance and a flue.

VENT PIPE—As applied to heating, means a pipe for removing products of combustion from gas appliances.

SMOKESTACK—A vertical flue constructed of metal, not insulated, to which is connected one or more smoke pipes.

HOOD—As applied to a heating device, is a canopy or similar device placed over a stove, range or other heating installation connected to a ventilating duct.

DRAFT HOOD—is a device placed in, and made part of the flue pipe from an appliance, or in the appliance itself, which is designed to (1) insure the ready escape of the products of combustion in the event of no draft, back draft or stoppage beyond the draft hood; (2) prevent a backdraft from entering the appliance; and (3) neutralize the effect of stack action of the chimney flue upon the operation of the appliance.

801.2 — FURNACE AND BOILER ROOMS

Every furnace installed in any building, other than a one or two family dwelling, shall be enclosed and separated from the rest of the building by walls, partitions, floor and ceiling of non-combustible construction or of one hour fire-resistive construction; provided that such furnace enclosure in buildings having a capacity for their particular use of more than seventy-five persons, or of Group E, Theaters or Assembly Occupancy shall be separated from the rest of such building by walls or partitions, floor and ceiling construction having a fire-resistive rating of not less than two hours, except as required below. In no case shall enclosing construction be located within two feet of the furnace.

Every steam boiler carrying more than fifteen (15) pounds per square inch pressure with a rating in excess of ten (10) boiler horsepower, installed in a building other than one of Group G, Industrial Occupancy, shall be located in a separated room, or compartment, and separated from the rest of the building by walls or partitions hav-

ing at least two hour fire resistance and by floor or ceiling construction having not less than two and one-half hour fire resistance.

SECTION 802—CHIMNEYS

802.1 (a) — GENERAL

Chimneys and flues shall be required for all heating or heat producing appliances except electrical heating and low flue gas temperature (where flue gas does not exceed 550 degrees F. at draft hood. See Section 802.4 (a)) appliances, except as otherwise provided for in this chapter.

No flue shall have smoke pipe connections in more than one story of a building.

Nothing in this Code shall prohibit the joining of two or more smoke pipes for a single flue connection, provided that smoke pipes and flues are of sufficient size to serve all of the appliances thus connected, and provided that, except for vents for gas appliances, the several smoke pipes are constructed to comply with the severest requirements for any one of those connected.

The smoke pipe of a heating appliance shall not be connected into the flue of an incinerator which has the rubbish chute identical with the smoke flue.

802.1 (b) — CHIMNEY CONSTRUCTION

No chimney shall carry any load other than its own dead weight.

All chimney foundations shall be of solid masonry, or of reinforced concrete, extending to at least six (6) inches below the earth's frost line. Such foundations shall distribute the weight of the chimney uniformly so as not to exceed one-half the bearing capacity of the soil. Such foundation shall be so proportioned and constructed to carry the entire weight of the chimney without settling or cracking.

No chimney shall be corbeled from a wall more than six (6) inches; nor shall such chimney be corbeled from a wall which is less than twelve (12) inches in thickness unless it projects equally on each side of the wall; provided that in the second story of two-story dwellings corbeling of chimneys on the exterior of the enclosing walls may equal the wall thickness. In every case the corbeling shall not exceed one (1) inch projection for each course of brick projected.

No change in the size or shape of a chimney, where the chimney passes through the roof, shall be made within a distance of six (6) inches above or below the roof joists or rafters.

All chimneys shall be properly capped with brick, terra cotta, stone, cast iron, concrete or other approved non-combustible, weather-proof material.

All chimneys which are or become unsafe or dangerous shall be made safe or taken down.

HEIGHT REQUIREMENTS

Chimneys shall extend at least three (3) feet above the highest point where they pass through the roof of the building and at least two (2) feet higher than any ridge within ten (10) feet of such chimney.

802.1 (c) — MATERIALS AND THICKNESS

Every chimney shall have a flue liner, or liners, as provided in sub-section 802.2 (a). The flue liner, or liners, are required in addition to the chimney wall thickness as herein specified. For high temperature flue requirements see Section 804.1.

BRICK

The walls of brick masonry chimneys shall be not less than three and three-quarter ($3\frac{3}{4}$) inches thick. All brick shall be laid with Class A or B mortar, full mortar joints struck smooth where exposed to the weather.

HOLLOW TILE

Chimney walls constructed of hollow tile, shall not be used as independent chimneys, but may be used where the chimney is built in connection with exterior or party walls of hollow units for buildings not exceeding two stories in height. The outer eight (8) inches of such a wall may serve as the outside wall of such a chimney.

CONCRETE

Chimney walls constructed of concrete cast in place, adequately reinforced both horizontally and vertically, shall be not less than three and three-quarter ($3\frac{3}{4}$) inches thick and shall have a flue lining as specified in Section 802.2. Where such reinforced concrete walls are at least six (6) inches in thickness in dwellings, flue lining may be omitted.

FIELD STONE

Chimney walls constructed of field stone shall be considered as coming within the limitations of brick masonry as specified above.

802.1 (d) — METAL CHIMNEYS

Metal flue assemblies may also be used provided they have been tested and approved by Underwriters' Laboratories, Inc. or other approved laboratories for the use intended. Such installations shall comply with the conditions upon which such approval is based.

802.1 (e) — RAISING ADJOINING CHIMNEYS

Whenever a building is hereafter erected, enlarged or raised, the owner of such building shall, at his own expense, carry up, either independently or on his own building, all chimneys and smoke flues

of an adjoining building which are within (10) feet of any portion of the wall extending above such chimney or flue.

The construction of such chimneys and flues shall conform to all the requirements of this Code. Such chimneys and flues shall be carried up simultaneously with the walls.

It shall be the duty of the owner of the building to be erected, enlarged or raised to notify, in writing, at least ten (10) days before such work is to begin, the owner of the chimneys and flues affected, of his intention to carry up such chimneys and flues.

802.2—FLUE LINING

(a) — WHERE REQUIRED

Every chimney shall have flue linings made of fire clay or other suitable refractory clays so designed and proportioned so as to withstand a temperature of 2,000 degrees F. without softening, cracking or physical or chemical change.

In no case shall clay flue linings be less than five-eighth ($\frac{5}{8}$) inch thick. The use of defective, cracked or broken flue linings shall not be permitted.

Flue linings may be omitted in reinforced concrete chimneys for dwellings where the thickness of such reinforced concrete is at least six (6) inches. (See Section 802.1(c), Materials and Thickness, Concrete.)

(b) — CONSTRUCTION

Flue linings shall be built ahead of the construction of the chimney as it is carried up, carefully bedded one on the other in Portland cement mortar with close fitting joints left smooth on the inside. All joints and spaces between the masonry and material shall be thoroughly slushed and grouted full as each course of masonry is laid.

Flue linings shall start at least eight (8) inches below the intake, or in the case of fire places, at the throat of the fireplace, and be carried as vertically as practicable to a point of not less than four (4) inches above the chimney walls.

All flues, other than fireplace flues, shall be equipped with cleanout doors. Such cleanout doors shall consist of a cast iron or steel door and frame arranged to remain tightly closed when not in use.

(c) — SIZE AND NUMBER OF FLUES

There shall be but one connection to a flue. Ordinary and low pressure heating devices burning solid or liquid fuel, shall have a minimum effective flue area of not less than the following:

Small Special Stoves and Heaters	28 Sq. In.
Stoves, ranges and room heaters	40 Sq. In.
Fireplaces (not less than 1/12 the fireplace opening)	96 Sq. In.
Warm air furnaces, steam and hot water boiler	64 Sq. In.

Such minimum effective flue areas shall be provided by a flue liner with short dimension not less than one-half ($\frac{1}{2}$) the long dimension.

Where more than two flues are contained in the same chimney each unit of two flues shall be separated from other flues by masonry not less than three and three-quarter ($3\frac{3}{4}$) inches thick bonded into the wall of the chimney. Adjacent flues, not so separated, shall have joints staggered not less than seven (7) inches.

When it is more economical or desirable to construct chimneys without flue lining, such chimney walls shall be not less than eight (8) inches thick and shall be lined with fire brick bonded in fire clay mortar starting not less than two (2) feet below the intake and extending for at least twenty-five (25) feet above the intake.

802.3 — FIRE PLACES

The back and sides of fireplaces shall be of solid masonry or reinforced concrete, not less than eight (8) inches in thickness. A lining of fire brick, at least two (2) inches thick, or other approved material, shall be provided unless the thickness is twelve (12) inches. Where a four (4) inch thickness of fire brick is used it may be included in the required minimum thickness of the fire places. Where the back of any fireplace forms or becomes a part of an exterior wall, there shall be a minimum solid masonry thickness of 4", plus 2" of fire brick placed on the inside of the fireplace. Fireplaces shall have hearths of brick, stone, tile or other approved non-combustible material supported on a fireproof slab or on brick trimmer arches. Such hearths shall extend at least twenty (20) inches in front, and not less than twelve (12) inches beyond each side of the fireplace opening. The combined thickness of hearth and supporting construction shall be not less than six (6) inches at any point.

Wooden forms or centers shall be removed when the supporting construction of the hearth is completed.

FIRESTOPPING

Spaces between chimneys and wood framing or combustible materials shall be firestopped by filling with non-combustible materials. (See Section 705 Firestopping Materials.)

FALSE FIREPLACES

False fireplaces may be used in connection with approved gas or electric heaters, provided such fireplaces are constructed of non-combustible materials.

802.4 — VENTING OF DOMESTIC GAS APPLIANCE

(a) — WHERE REQUIRED AND INSTALLATION

See plumbing ordinance.

(b) — RESTRICTIONS

No vent pipe from any gas appliance shall be inter-connected with any other vent pipe, smoke pipe, or flue, unless such gas ap-

pliance is equipped with an automatic device to prevent the escape of unburned gas at the main burner or burners. Where a gas appliance vent pipe is joined with a smoke pipe from an appliance burning some other type of fuel, for a connection into a single flue opening, they shall be joined by a "Y" fitting located as close as practicable to the chimney.

Wherever practicable, all vents shall be true and straight and free of elbows or bends in concealed spaces.

802.5 — SMOKEPIPES

All smokepipes shall be connected to a chimney and flue conforming to the provisions of Section 802.1 Chimneys.

Smokepipes shall be as short and straight as possible. Smokepipes shall be constructed of not less than 24 U. S. Gauge uncoated steel sheet, or integrally water proofed asbestos cement pipe, not less than 0.25 inches in thickness. Joints shall lap not less than one and one-half (1½) inches and where metal pipe is used it shall be secured with not less than three (3) sheet metal screws in each joint. Smokepipes shall be supported, where necessary, by metal straps.

Where the smokepipe enters the flue, a fire clay tile thimble shall be cemented into the chimney. Such connections shall be air-tight.

No smokepipe shall pass through any floor or ceiling. Where smokepipes pass through a partition they shall be provided with a double metal ventilated thimble not less than twelve (12) inches larger in diameter than the pipe.

Smokepipes shall not come within eighteen (18) inches of any unprotected combustible material, whether plastered or unplastered.

802.6 — FURNACE AND BOILERS FOR DWELLING FOUNDATIONS

The furnace or boiler foundation shall be of brick, cement or other incombustible material not less than four (4) inches in thickness. Foundations shall extend at least twelve (12) inches beyond rear and sides of furnace or boiler and at least twenty-four (24) inches in front.

CLEARANCE

The minimum clear distance between any furnace or boiler (not over fifteen (15) pound pressure, and any combustible material shall be not less than eighteen (18) inches above and at the sides and rear and not less than forty eight (48) inches at the front.

The surfaces of combustible materials less than thirty (30) inches above a furnace or boiler shall be covered with asbestos sheet rock or other approved fire-resistive materials approved by the Building Official and whose edges shall extend at least twelve (12) inches beyond the edges of top of the heating unit.

SECTION 803—MEDIUM TEMPERATURE REQUIREMENTS

803.1—SMOKE FLUES

Smoke flues of high pressure (over fifteen (15) pounds pressure) steam boilers, smokehouses and other medium temperature appliances shall be encased in approved masonry or concrete not less than eight (8) inches thick; provided that stone masonry shall be not less than twelve (12) inches thick; (For metal smokestacks see Section 804.4) and in addition, shall be lined with not less than four and one-half (4½) inches of fire brick bonded in fire clay mortar, starting not less than two (2) feet below the intake and extending at least twenty five (25) feet above the intake.

SECTION 804—HIGH TEMPERATURE REQUIREMENTS

804.1—SMOKE FLUES

Smoke flues of cupolas, brass furnaces, procelain baking kilns and other high temperature appliances shall be built with double walls, each not less than eight (8) inches in thickness with an air space of not less than two (2) inches between them. The inside of the interior wall shall be of fire brick not less than four and one-half (4½) inches in thickness bonded in fire clay mortar.

804.2—CUPOLA CHIMNEYS

Chimneys of cupola furnaces, blast furnaces and similar devices shall extend at least twenty (20) feet above the highest point of any roof within a fifty (50) foot radius and shall be covered on the top with a heavy wire netting or other approved spark arrester.

804.3—INCINERATORS

(a)—COMBUSTION CHAMBERS

Every incinerator shall have all walls of the fire box, or combustion chamber, of solid masonry or reinforced concrete not less than eight (8) inches thick if the grate area does not exceed sixteen (16) square feet. If the grate area exceeds sixteen (16) square feet, the wall shall be not less than twelve (12) inches thick. In either case the inner four (4) inches shall be of fire brick bonded in fire clay mortar. In the ash chamber below the fire grade, the fire brick may be omitted.

(b)—CHIMNEYS AND FLUES

Incinerator chimneys with grate areas less than sixteen (16) square feet shall conform to Section 802.

Incinerator chimneys with grate areas over sixteen (16) Sq. Ft. shall conform to Section 803.

All incinerator chimneys shall be covered on the top with an approved spark arrester.

804.4 — METAL SMOKESTACKS

Metal smokestacks shall be painted, galvanized or given other approved protection, and if used for high pressure boilers or furnaces, shall be lined with a four and one-half (4½) inch thickness of fire brick bonded in fire clay mortar for not less than twenty-five (25) feet from the intake and shall be protected on the outside up to and through the roof with at least a No. 18 U. S. Gauge sheet metal shield which provides an eight (8) inch ventilated air space between the stack and shield, or such stacks shall be protected by not less than four hour fire resistive protection.

Where smokestacks are mounted directly on boilers which are designed to support the stack load, such load shall not be in excess of that specified by the manufacturer.

804.5 — HIGH PRESSURE BOILERS, OR HIGH TEMPERATURE FURNACES

All high pressure boilers or high temperature furnaces shall be so located with clearance from all combustible material of at least ten (10) feet at the sides and rear and not less than fifteen (15) feet above, and not less than thirty (30) feet at the front or side where hot products are removed. (See Section 801.2 Boiler and Furnace separations.)

SECTION 805—HEATING, AIR CONDITIONING AND VENTILATING DUCTS

This section applies to air conditioning, warm air heating, air cooling and ventilating systems employing either gravity or mechanical means for the movement of air through ducts. For ventilating systems for the removal of dust, smoke, fumes, gases, vapors, odors or other hazardous, obnoxious, or injurious impurities see Section 2001.1.

805.1 — MATERIALS

All air ducts shall be constructed entirely of iron, steel or other approved non-combustible material. Only approved non-combustible material or approved fire-resistive linings shall be used inside of ducts.

Work involving torches shall not be undertaken on ducts until the system has been shut down, the duct cleaned and all combustible lining and covering material has been removed from the portion being repaired.

Ducts shall be so constructed as to provide ample strength to meet the conditions of service for which they are used. In no case shall their structural strength and durability be less than the equivalent of galvanized sheet iron or steel of the thickness indicated in Table 805. Wire glass may be used for inspection windows in ducts.

TABLE 805 — THICKNESS OF METAL FOR AIR DUCTS

Round Ducts Diameter (Inches)	Rectangular Ducts Width (Inches)	Minimum Thickness U. S. Gauge
Up to 18	Up to 12	26*
Over 18 to 30	Over 12 to 30	24*
Over 30 to 45	Over 30 to 48	22
Over 45 to 60	Over 48 to 60	20
60 and above	60 and above	18

*In 1-and 2-family dwellings these gauges may be changed to 28 gauge and 26 gauge respectively.

805.2 — FIRE PROTECTION

If ducts are formed by parts of the building structure, their construction shall consist of not less than three-quarter ($\frac{3}{4}$) inch cement or gypsum plaster on metal lath or equivalent protection, applied to those parts, if such parts are combustible.

Ducts shall be tight throughout with no openings except those essential to the required function of the system. Ducts shall be substantially supported by metal hangers or brackets.

Where ducts pass through walls, floors or partitions, the space around the duct shall be sealed with rope asbestos, mineral wool or other non-combustible material to prevent the passage of flame and smoke.

Where ducts pass through concealed ceiling spaces of combustible construction or are located inside combustible partitions or walls, either the ducts or the interior surface of such enclosing space shall be protected with one-quarter ($\frac{1}{4}$) inch asbestos or other equivalent approved insulating material, or a minimum clearance of one-half ($\frac{1}{2}$) inch shall be provided. However, warm air ducts which run approximately horizontal near combustible construction which is either plastered or unplastered, shall have a clearance of not less than six (6) inches except that the minimum clearance shall be one (1) inch where ducts are of metal covered with one-half ($\frac{1}{2}$) inch or more of approved non-combustible insulating material.

Where ducts pass through floors, (except in the case of dwellings) fire protection shall be provided as specified in Section 701—Protection of Vertical Openings. Such construction, however, shall not be required for branches which are cut off from the main duct by approved fire dampers.

805.3 — RETURN AND SUPPLY DUCTS

Return ducts, and supply ducts, unless air passes through either water spray or filters, other than vertical, shall be so constructed that their interior is accessible for cleaning except that the Building Official may waive this requirement if the occupancy is not productive of lint, greasy vapors, or other combustibles. (For occupancies such as banks, office buildings, churches, institutions and hotels, the

requirements may be waived except for kitchens, service rooms, and rooms used for manufacturing purposes.)

Ducts shall not pass through fire walls unless unavoidable; in such cases approved automatic fire doors or shutters shall be provided on both sides of the wall. On such wall openings not exceeding eighteen (18) inches in diameter, three-eighths ($\frac{3}{8}$) inch steel plates may be used as fire doors.

Fresh air intakes shall be protected against exterior fire and smoke exposure by approved doors, dampers or other protectives.

No room, attic, void, hollow or concealed space, nor other part of building shall be used as part of a blower or exhaust system unless it is an integral part of such system and used for no other purpose, and is constructed of non-combustible materials fire protected to meet the approval of the Building Official.

Duct systems shall be constructed and installed to meet the "Standards of the National Fire Protection Association for the Installation of Air Conditioning, Warm Air Heating, Air Cooling and Ventilating Systems" (NBFU Pamphlet 90, 1950) except as otherwise provided herein.

SECTION 806—STEAM AND HOT WATER PIPES

806.1 — CLEARANCE

Proper clearance from combustible material shall be not less than one (1) inch on all sides. Where such pipes pass through partitions or floors the openings shall be filled with non-combustible material, or such space shall be enclosed by metal plates.

806.2 — ENCLOSED PIPES

Where steam or hot water pipes are enclosed in partitions, walls, floors or casings of combustible material such material shall be protected with a metal shield or such pipes shall be covered with approved non-combustible material.

SECTION 807—FIRE PROTECTION OF MISCELLANEOUS HEATING DEVICES

807.1 — STOVES, RANGES, HOT WATER HEATERS AND OTHER APPLIANCES

(a) — RANGE HOODS

Ranges, candy kettles, cruller furnaces and appliances for the frying of confectionery or bakery products (except ranges or stoves for dwellings or apartments) shall be provided with ventilating hoods and ducts to remove smoke, gases and vapors.

Hoods shall be raised not more than seven (7) feet above the floor. The size of such hood shall be not less than the width and breadth of the appliance it serves.

Such hoods and ducts shall be constructed of non-combustible materials with independent masonry flues conforming to the requirements of Section 802. Where such connection is uneconomical or impractical, ducts may be connected to an independent metal stack outside the building. In either case, such flues and stacks shall be used for no other purpose. The ducts shall not be connected with any other ventilating system.

Such hoods and ducts shall be installed to provide a clearance to woodwork or any combustible material of not less than twelve (12) inches.

(b) — BURNING SOLID OR LIQUID FUELS

Every cooking stove, range, water heater or any other heating appliance burning solid or liquid fuel without an open space beneath its base, shall be securely and firmly set on not less than two hour fire resistive construction as set forth in Chapter X. Such construction shall extend not less than twelve (12) inches beyond the appliance on all sides and not less than eighteen (18) inches on side from which ashes are removed.

Where approved appliances, set on supports providing not less than (4) inches open space under the base, are mounted on wood floors, such floors shall be protected with not less than No. 24 U. S. Gauge sheet metal extending at least six (6) inches beyond the appliance on all sides and eighteen (18) inches on side where ashes are removed.

Every heat appliance burning solid or liquid fuel shall be connected to a chimney. (See Section 802.1(a).)

CLEARANCES

There shall be a minimum of twelve (12) inches clearance on all sides from all combustible material for heat appliances burning solid or liquid fuel. Should such heat appliance be located with less than twelve (12) inches clearance from any combustible material, one hour fire resistive protection shall be provided as specified in Chapter X.

(c) — BURNING GAS

Every gas burning stove, range or hot water heater shall have a clearance of at least six (6) inches from any partition, wall, floor or any combustible material unless such material is shielded by not less than 24 U. S. Gauge metal, or unless such partition, wall or floor be of not less than one hour fire resistive protection, as specified in Chapter X.

807.2 — OTHER GAS APPLIANCES

(a) — GENERAL

All miscellaneous gas appliances, including wall heaters, floor furnaces, and unit heaters, shall be on the list of approved appliances by the Underwriters' Laboratories, Inc., or the American Gas Association Testing Laboratories.

(b) — WALL HEATERS

Wall heaters shall not be installed in walls of combustible construction unless they conform to the requirements of Section 807.2(a).

(c) — GAS FLOOR HEATERS

All gas floor furnaces shall conform to the requirements of Section 807.2(a) and shall be equipped with a gas pressure regulator. Gas floor furnaces shall have a clearance of not less than six (6) inches from any combustible material. They shall be vented to the outside in accordance with the provisions of Section 802.4. Dampers or similar devices shall not be installed on the vent pipe from a gas furnace.

All openings in the floor for floor furnaces shall be provided with headers and properly supported to carry the imposed load without weakening the floor structure. There shall be provided an open and unobstructed passageway to every floor furnace of not less than two (2) feet in height by two (2) feet in width. In no event shall a gas floor furnace be placed less than six (6) inches off the ground.

(d) — UNIT HEATERS (CEILING TYPE)

All unit heaters shall conform to the requirements of Section 807.2(a). Ceiling type unit heaters shall be substantially supported by metal hangers, brackets and supports. Every gas unit heater shall have a clearance of at least eighteen (18) inches in all directions from any combustible material, whether plastered or unplastered.

SECTION 808—FUEL OIL AND COMPRESSED GAS SYSTEMS

For regulations concerning the use, handling and storage of fuel oil or compressed or liquid gas fuels see Section 501.1(f).

SECTION 809—GAS FEED LINES

Where gas is used as fuel for heating in buildings of Group A and Group B Occupancy; Group C, Schools, Group D, Institutional; Group E, Public Assembly and Group H, Hazardous, gas feed lines shall not be placed through or under a foundation, nor shall they be concealed except in specially constructed ducts ventilated to the outside approved by the Building Official. All such gas feed lines shall be provided with outside shutoff valve, plainly and clearly indicated as such.

CHAPTER IX

SPRINKLERS AND STANDPIPES

SECTION 901—SPRINKLERS

Where required in this code, only approved sprinklers shall be used in automatic sprinkler systems and the complete layout of the system shall be approved by the Building Official before installation is made.

Every automatic sprinkler system required by this code shall conform with the requirements of the "Standards of the National Fire Protection Association for the Installation of Sprinkler Equipments," (National Fire Codes, Volume IV, 1946 Edition), except that a single water supply of adequate pressure, capacity and reliability, equal to the primary supply required by those Standards, may be permitted by the Building Official.

For the purpose of application of the "National Fire Protection Standards for Sprinkler Equipment," occupancies of Groups A, B, C, D and E shall be considered as "Light Hazard Occupancies"; of Groups F and G as "Ordinary Hazard Occupancies"; of Group H as "Extra Hazard Occupancies."

Piping shall be of wrought iron or steel. Sprinkler systems shall be designed to withstand, under service conditions, a water pressure of not less than 200 lbs. per square inch for 2 hours without leakage and shall be tested in the presence of the Building Official before final approval and acceptance.

Only approved sprinklers, fittings, connections and valves shall be used in the installation of sprinkler systems.

Every sprinkler system shall be provided with an approved outside screw and yoke valve or indicator gate valve, in an accessible location, to control all sources of water supply other than that from the fire department connection.

All hose threads in connections shall be uniform with that used by the fire department of the city.

In addition to the requirements specified elsewhere in this code, approved automatic sprinkler equipment meeting the requirements of this Section shall be installed in buildings as follows:

In basements or cellars with ceiling less than 4 Ft., 6 In. above grade, having floor areas exceeding 3,500 square feet when used as workshops or for the manufacture, repair, sale or storage of combustible materials shall be equipped with approved automatic sprinkler systems, except that in Group A: Residential, Group C: Schools, and Group D: Institutional Buildings, only those portions need be sprinklered that are used for such purposes.

In garages approved automatic sprinklers shall be provided as follows:

1. In garages having an area exceeding 2,000 square feet that are of other than Type I fireproof construction and that are used for the storage of loaded commercial trucks.

2. In bus garages exceeding 2 stories in height.

3. In basement or sub-basement garages housing more than three motor vehicles.

4. In garages located in buildings in which parts thereof above such garages are occupied for other purposes, where such garages have a capacity of 20 or more automobiles, or are used as terminals for three or more buses, or are used for storage or loading of three or more trucks.

In occupancies of Group E: Theaters and Assembly, sprinkler equipment shall be provided as specified in Section 512.23.

Film exchanges, laboratories, and studios shall be equipped with approved automatic sprinkler systems as required in Section 501.3 (a).

In buildings of Group H: High Hazard Occupancies, sprinklers shall be installed as required in Section 501.2 (d).

All sub-basement rooms exceeding 2,500 square feet in area, except machinery rooms, of construction other than Type I: Fireproof, shall have approved automatic sprinkler equipment.

Sprinkler equipment shall also be provided in stores and similar Group B Occupancies where stocks of combustible materials are on display for public sale and where the floor area exceeds 20,000 Sq. Ft. and in buildings other than herein specified, where because of the high fire hazard represented by their combustible content or by their use, such protection is deemed necessary by the Building Official.

SECTION 902—STANDPIPES

902.1 — WET STANDPIPES

Wet standpipes for the purpose of this code, shall be those which have a primary water supply constantly available at every hose outlet or made available automatically when the hose valve at any outlet is opened or when a control station functions.

902.2 — DRY STANDPIPES

Dry standpipes for the purpose of this code, shall be those having no permanent or automatic water supply. They are intended for supply and use by the fire department.

902.3 — WHERE REQUIRED

In buildings of Group E: Theater or Assembly, and of Group H: High Hazard Occupancies, and in those buildings where standpipes are required by other sections of this code, wet standpipes shall be provided.

Wet standpipes shall also be provided in all buildings over 55 feet in height except that in such buildings where in the opinion of the Building Official and of the Chief of the Fire Department such constant and automatic water supply is not necessary because of the occupancy and type of construction, with their approval dry standpipes may be substituted for one or more of the required wet standpipes.

For standpipe requirements in Group E: Theater or Assembly Occupancies see Section 412.25.

902.4 — NUMBER OF STANDPIPES

The number of wet standpipes shall be such that a nozzle attached to 100 feet of one and one-half ($1\frac{1}{2}$) inch hose connected to a two and one-half ($2\frac{1}{2}$) inch standpipe, will reach to within 30 feet of all parts of the floor area.

902.5 — LOCATION OF STANDPIPES

Standpipes shall extend from the lowest story of the building to the topmost story and shall be so located that they are protected against mechanical and fire damage, with outlets within stairway enclosures; provided that in buildings heretofore erected in which the stairways are not enclosed, the standpipe outlets shall be located as near the stairway as possible or they shall be outside or immediately inside of the exterior walls, within one foot of a fire tower, exterior stairway or fire escape.

902.6 — CONSTRUCTION

Unless otherwise provided herein, standpipes, standpipe systems, hose, water supply, pumps, connections, etc. shall be constructed and installed to meet the "Regulations of the National Board of Fire Underwriters for the Installation of Standpipe and Hose Systems," except that a single source of water supply, if reliable and capable of automatically supplying the required service, may be approved by the Building Official.

Standpipes shall be constructed of wrought iron or steel with approved fittings, connections and valves, and shall be designed to withstand a working pressure of not less than 100 Lbs. per square inch in excess of the static head of water due to the height of the standpipe.

Minimum diameter of standpipes shall be not less than four (4) inches except that it shall be not less than six (6) inches in buildings exceeding seventy-five (75) feet in height.

Standpipes shall be equipped in every story with $2\frac{1}{2}$ inch hose connections, and valves located not more than five (5) feet above the floor level. All hose threads in connections shall be uniform with that used by the fire department of this city. Each standpipe shall be equipped with a Siamese fire department inlet connection located on a street front of the building not less than eighteen (18) inches or more than thirty-six (36) inches above the grade level. The pipe from

the standpipe to the Siamese connection shall be at least four (4) inches diameter. Stop valves or check valves shall be provided to permit cutting off any standpipe riser without interrupting the supply to other risers from some source of supply. Approved provision shall be made to prevent freezing.

Where more than one wet standpipe is installed in a building, they shall be connected at their bases by pipes of a size equal to that of the largest standpipe.

902.7 — SIGNS

Each outside connection shall be marked to identify its use by a metal sign rigidly attached to the building having raised letters reading "Connection to Wet Standpipe" or "Connection to Dry Standpipe", as the case may be.

902.8 — HOSE

Sufficient hose shall be provided to reach all parts of floor area served by standpipe, but not in excess of 75 feet of one and one-half (1½) inch hose attached to each outlet.

902.9 — DRY STANDPIPES REQUIRED

In buildings 55 ft. or more in height there shall be at least one dry standpipe. One additional dry standpipe shall be provided, for each 10,000 Sq. Ft., or fraction thereof, by which the area of any floor above the second floor exceeds 10,000 Sq. Ft., in area.

CHAPTER X

FIRE RESISTIVE RATINGS FOR MATERIALS AND CONSTRUCTION

SECTION 1001—GENERAL

Fire protection requirements of this code are based on fire-resistance ratings. Such ratings are established in this chapter for various building materials, assemblies and thicknesses. Other materials, thicknesses, assemblies and constructions of necessary strength and durability for the use intended, which have successfully performed under tests made by a recognized laboratory in accordance with the requirements of the "Standard Specifications for Fire Tests of Building Construction and Materials" (E-119-47) of the American Society for Testing Materials, shall be accepted by the Building Official for specific ratings in lieu of those prescribed in this chapter. Thicknesses as established in this chapter shall be construed as establishing minimum requirements for fire resistance only and shall not preclude the application of other requirements of this code where considerations of strength, durability or stability require greater thicknesses.

No combustible materials shall enter into the construction of assemblies except as hereinafter provided or otherwise accepted on the basis of the foregoing prescribed tests.

Fire doors, curtains, shutters, windows, or other protection for openings shall be in accordance with the requirements of Section 703.

Roof Coverings shall be in accordance with Fire District Requirements in Section 301.2 and permissible classes in Section 706.

1001.1 — GENERAL REQUIREMENTS—WALL AND PARTITION RATINGS

Plaster—Where higher fire ratings are indicated in Tables 1002 (a) and 1002 (b) because of the addition of plaster, the higher rating applies only when the plastered face is exposed to the fire.

Whenever wall assemblies specify plastering, gypsum or portland cement plaster, not less than $\frac{1}{2}$ inch thick shall be used, except that on gypsum units, gypsum plaster only shall be used. Plaster on metal lath, as described in Table 1002 (b), shall be measured from the back plane of the flat portion of the lath, and shall have a minimum thickness of $\frac{3}{4}$ inch.

Gypsum plaster as required for the fire ratings indicated in this chapter, may be fibered or unfibered.

Thickness of Walls—The thicknesses required in Table 1002 (a) for masonry and tile walls and partitions of the various fire resistance ratings do not include the thickness of plaster.

Mortar—For the fire ratings indicated in Tables 1002 (a) and 1002 (b) masonry walls shall be laid in portland cement—lime mortar. Mix shall not be leaner than 1:1:6 for all brick walls and for

all concrete block walls, except that solid brick wall 8" and over in thickness may be laid in 1:3 portland cement or lime mortar. Mix of mortar for structural clay tile walls shall not be leaner than 1:1:4 mix.

"Gypsum partition tile and block shall be laid in gypsum mortar, composed of 1 part gypsum to not more than 3 parts sand by weight. Non-bearing partitions and fireproofing of structural clay tile may be laid in gypsum mortar."

Closure of Ends—All open cells in tile or block occurring at wall ends shall be filled solid with concrete or gypsum for at least a depth of 6 inches, or solid units or closure tile set in opposite direction shall be used. No fire wall of hollow units and no 8 inch solid wall shall be broken into, subsequent to erection, for chases or the insertion of structural members.

Maximum Allowable Heights of Partitions—All masonry, tile, or block partitions required to have a specific fire-resistance rating by the provisions of this code shall be limited, in height not to exceed thirty times their thickness, except where rating for greater height has been established by actual fire tests.

Firestopping—Hollow partitions shall be firestopped with incombustible materials at every floor.

Metal Lath—Metal or wire lath used in fire resistant walls or partitions shall meet the requirements of Section 1008.6.

Walls and Partitions Supporting Framing Members—The total thicknesses of masonry and concrete walls or partitions in Table 1002 (a) are minimum and apply only if members supported by them are none or non-combustible.

When combustible members are supported by solid masonry or solid concrete walls, the minimum thickness of walls, exclusive of plaster, shall be not less than the thickness required in Table 1002 (a) increased by an amount equal to 2" less than the depth of bearing of such members. The minimum bearing shall not be less than 4".

When combustible members are supported by hollow masonry walls or by walls of hollow masonry units, the fire-resistance rating thereof will be the same as that for non-combustible or no members supported by such walls if the space above, below, and between such members, and the space between their ends and the opposite face of the wall is filled solid with masonry, concrete or equivalent fire-resisting material to a depth of not less than (4") but in no case shall the rating exceed the rating for solid walls of the same thickness having combustible members supported by them.

For plaster on one side of walls or partitions which support combustible members from both sides, the fire-resistance rating for such walls or partitions shall apply only for the exposure to the side which is plastered. The rating for exposure to the unplastered side shall be the same as for the same wall if unplastered.

Ratings—The ratings marked *** in Tables 1002 (a) and 1002 (b) apply to non-load-bearing walls and partitions only. All other ratings in Tables 1002 (a) and 1002 (b) apply to both load-bearing and non-load-bearing walls and partitions.

SECTION 1002—FIRE RESISTANCE RATINGS FOR WALLS AND PARTITIONS

Fire resistance ratings for walls and partitions shall be in accordance with this section.

**TABLE 1002 (a) FIRE RESISTANCE RATINGS
WALLS AND PARTITIONS**

Plaster on one side			4-1 5/16	3-1
Plaster on one side	6-2	8-1¾	4-1	
	8-1¾			

NOTE—In each pair of numbers, the first numeral is thickness of wall and second numeral is thickness of face shell.

*Must be plastered one side for burned clay or shale aggregate.

**Two-hour rating for volcanic pumice aggregate.

TABLE 1002 (b)—FIRE RESISTANCE RATING—WALLS—PARTITIONS

STEEL FRAMED BRICK VENEERED WALLS

Steel studs faced one side with 1" insulation board, 1" air space and $\frac{3}{4}$ " brick veneer attached to steel frame every fifth course, and faced on the other side with plaster finish, as described below, applied on metal (or wire) lath attached to the studs:

	Fire Rating Hours
Fire rating for exposure on brick face of wall	4
Fire rating on plaster face— $\frac{7}{8}$ " sanded gypsum plaster	
1:2 mix) applied on metal or wire lath	1¾
— $\frac{7}{8}$ " vermiculite plaster or 1" sanded gypsum plaster	
(1:2 mix) applied on metal or wire lath	2

**TABLE 1002 (b)—FIRE RESISTANCE RATING—WALLS—
PARTITIONS (Continued)**

Fire rating—either face—If the 1" of insulating material is located on the plaster side of the steel studs instead of on the brick veneer side, the above fire resistance ratings may be increased to 4 hours on both faces and the thickness of plaster may be reduced to $\frac{3}{4}$ " of sanded gypsum plaster 1:2 mix for scratch and 1:3 for brown coat.	Fire Rating Hours
	4

Steel studs faced one side with $\frac{1}{2}$ " gypsum sheathing board and 3 $\frac{3}{4}$ " brick veneer attached to the steel studs; and faced on the other side with $\frac{1}{2}$ " perforated gypsum lath (see Sect. 1008.5) securely attached to steel studs and having strips of metal lath 3" wide applied to all horizontal joints of gypsum lath, plastered with $\frac{1}{2}$ " sanded gypsum plaster of 1:2 mix, a fire resistance rating on the plaster side of	2
--	---

WOOD FRAMED PLASTER PARTITIONS

Fire rating—Portland Cement plaster $\frac{7}{8}$ " thick of 1:2 scratch coat, 1:3 brown coat, with 3 pounds of short asbestos fiber per bag of Portland cement, applied to metal or wire lath, attached to both sides of 2" x 4" Wood stud framing, effectively firestopped.	1
---	---

—Sanded gypsum plaster $\frac{3}{4}$ inch thick of 1:2 scratch coat, 1:2 brown coat, applied to metal or wire lath, attached to both sides of 2"x4" wood stud framing effectively fire stopped.	1
---	---

Vermiculite Gypsum plaster $\frac{3}{4}$ inch thick, on metal or wire lath attached to both sides of 2"x4" wood studs, effectively fire stopped.	1
--	---

Sanded gypsum plaster $\frac{7}{8}$ inch thick of 1:2 scratch coat, 1:3 brown coat applied to metal lath, attached to both sides of wood stud framing effectively fire stopped.	1
---	---

Sanded gypsum plaster $\frac{1}{2}$ inch thick of 1:2 mix applied to $\frac{3}{8}$ inch perforated gypsum lath attached to both sides of 2 inch by 4 inch wood-stud framing, effectively fire-stopped.	1
--	---

Gypsum-vermiculite or gypsum-perlite plaster, $\frac{1}{2}$ inch thick of 2 $\frac{1}{2}$ cu. ft. of vermiculite or perlite to 100 lbs. of gypsum on $\frac{3}{8}$ inch perforated gypsum lath attached to both sides of 2-inch by 4-inch wood stud framing effectively fire-stopped.	1
---	---

Two layers of $\frac{1}{2}$ inch gypsum wallboard attached both sides of wood studs, effectively fire-stopped.	1
--	---

SOLID PLASTER STUDLESS PARTITIONS***

Gypsum plaster applied to metal or wire lath supported on $\frac{3}{4}$ " steel channels:

Fire rating—2 $\frac{1}{2}$ " unsanded gypsum plaster	2 $\frac{1}{2}$
—2 $\frac{1}{4}$ " unsanded gypsum plaster	2

Table 1002 (b)—cont'd.

—2" sanded gypsum plaster (1:½ mix)	1½
—2" sanded gypsum plaster (1:1 mix) or 2¼" sanded gypsum plaster (1:2 mix)	1
—13/16" sanded gypsum plaster (1:1 mix for scratch, 1:2 for brown coat) applied to each side of ¾" long-length gypsum lath inserted at top and bottom in steel or non-cumbustible runners; total thickness of partitions not less than 2".	1
—2" studless sanded gypsum plaster (1:2 mix) on diamond mesh or rib metal lath.	1

HOLLOW STEEL-FRAMED PARTITIONS

Steel studs to both faces of which is attached gypsum plaster applied to metal (or wire) lath: Not less than 2" air space shall be provided.

Fire rating—1" unsanded gypsum plaster	2½
—¾" unsanded gypsum plaster or 1" sanded gypsum (1:½ mix)	2
—¾" sanded gypsum plaster (1:½ mix) or ¾" unsanded	1½
—¾" sanded gypsum plaster (1:2 mix)	1
—¾" sanded gypsum plaster (1:2 Scratch, 1:3 Brown Coat)	1
—¾" Portland cement plaster (1:2 Scratch, 1:3 Brown Coat, 3 lbs. asbestos fiber per bag of cement)	1

GYPSUM BLOCK PARTITIONS***

Solid—Unplastered 4 inch block	3
Unplastered 3 inch block	2
Unplastered 2 inch block	1
Hollow—Plastered two sides with ½" 1:3 sanded gypsum plaster	
4 inch block	3
3 inch block	2
Hollow—Unplastered not less than 70% solid 3 inch block 1 hour	

SECTION 1003—FIRE-RESISTANCE RATINGS FOR PROTECTED STEEL COLUMNS

Fire-resistance ratings for protected steel columns shall be in accordance with this section.

Table 1003—Ratings for Steel Columns Minimum thickness outside of column (in inches) for ratings of:

Protective Materials	4 hrs.	3 hrs.	2 hrs.	1 hr.
Solid concrete of Grade A (Sect. 1008)	2			
Solid concrete of Grade B (Sect. 1008)	3	2½	2	
Hollow Clay Tile—unplastered	4(a)	(a)	(a)	(a)
—plastered with ¾" sanded gypsum				

**TABLE 1003—FIRE RESISTANCE RATINGS STEEL
COLUMNS (Continued)**

	4-hrs.	3-hrs.	2-hrs.	1-hr.
plaster 1:3 mix and having $\frac{3}{4}$ " mortar between column and tile	2(a)			
Hollow Clay Tile—with concrete fill extending 1" outside column on all sides. With $\frac{3}{4}$ " mortar between tile and column (no fill of reentrant space) and with outside wire ties.	2			2
Gypsum—Poured solid with 4"x4" wire mesh reinforcement wrapped around column	2	1½	1½	1
Gypsum—block solid, with $\frac{1}{2}$ " mortar between column and block, unplastered on outside			2	2
Gypsum—block, solid with $\frac{1}{2}$ " sanded gypsum plaster and mortar fill	2			
Gypsum—block, hollow, unplastered, no fill			3	
Concrete—block, hollow, filled with $\frac{1}{4}$ " mortar between column and blocks and with $\frac{3}{4}$ " sanded gypsum (1:3 mix) plaster	3			
Brick—Clay or shale brick, reentrant space filled with brick and mortar	3¾	3¾	3¾	2¾
Plaster—sanded gypsum (1:3 mix) on wire or metal lath				¾
Plaster—Column protected by 1" Vermiculite—Gypsum plaster on metal lath; lath spaced $\frac{1}{4}$ " from column; space behind lath or flange faces filled with Vermiculite plaster	1			
Plaster—portland cement (1:2-½ mix) on wire or metal lath				1
Plaster—as above, in two layers with $\frac{3}{4}$ " air space between provides fire resistance rating of 2½ hours.				
Plaster—Column protected by vermiculite gypsum plaster on metal lath spaced $\frac{1}{4}$ " from column, space between lath and column flanges filled with plaster; no back-fill. Vermiculite gypsum plaster of the following thicknesses over the face of the lath.	1½	1		
Thickness of plaster applied to metal lath shall be measured from the back plane of the flat portion of the lath.				
Steel Columns, Partly Protected with Concrete				
Steel columns of solid section (not latticed) unprotected outside				

but having reentrant space filled with concrete of Grade A, and having minimum area of solid materials not less than 64 square inches, shall have fire resistance rating of 1 hr.

Reference Notes—Table 1003. Ratings for Steel Columns

(a) Structural steel columns protected with 2" hollow clay or shale tile having wire mesh in horizontal joints, flanges covered with mortar or concrete, and having reentrant space filled with concrete, shall have fire resistance ratings as indicated below, depending upon the cross-sectional area of the solid material:

Minimum area of solid material 225 Sq. In.	Rating—4 Hrs.
Minimum area of solid material 180 Sq. In.	Rating—3 Hrs.
Minimum area of solid material 110 Sq. In.	Rating—2 Hrs.
Minimum area of solid material 80 Sq. In.	Rating—1½ Hrs.

**GENERAL REQUIREMENTS—RATINGS FOR STEEL COLUMNS,
TABLE 1003**

THICKNESSES—The thicknesses in Table 1003 refer to thicknesses of protective material before the application of plaster except that the thickness indicated for plaster protection is total plaster thickness. Thicknesses shall be measured from the extreme outer edge of the member, except that the thickness of protective material required at the extreme edges of lugs, brackets, wind bracing and other connections shall be not less than 1 inch.

FILL OF REENTRANT SPACE—For 3-hour and over protection, all interior or reentrant spaces shall be filled with concrete or with the same material as the protection; unless the omission of the back-fill is specifically permitted in Table 1003 and provided that in the case of gypsum block protections, such filling may be omitted when blocks are so anchored or tied together as to preserve the integrity of the protection for the required fire period.

REINFORCEMENT—Poured protection shall be adequately reinforced with not less than 4"x4" wire mesh weighing not less than 1½ lbs. per square yard, or equivalent reinforcement.

MORTAR JOINTS—Protective coverings consisting of masonry units shall be solidly bedded and laid in cement gypsum or lime-cement mortar, except that gypsum blocks shall be laid in gypsum mortar.

BONDS AND TIES—Block and tile protective coverings shall be securely anchored or bonded by wall ties or metal mesh laid in the horizontal joints, by metal clips connecting one unit to another, by outside tie wires not smaller than No. 12 B and S gauge (0.08 diameter) with at least one such tie around every course, or by means of specially designed units providing positive anchorage to the member or to other units. Outside tie wires shall in all cases be protected by at least ½ inch of mortar or plaster.

PLASTER—Wherever plaster is required in Table 1003, gypsum or Portland cement plaster not less than ½ inch thick shall be used,

except that on gypsum units, gypsum plaster only shall be used.

METAL LATH—Where metal or wire lath is specified in Table 1003, it shall meet the minimum requirements of Section 1008.6.

SECTION 1004 — FIRE-RESISTANCE RATINGS FOR PROTECTED STEEL BEAMS, GIRDERS AND TRUSSES

TABLE 1004

Ratings for Steel Beams,

Girders and Trusses

Minimum Thickness in inches for ratings of

Protective Materials	4 Hrs.	3 Hrs.	2½ Hrs.	2 Hrs.	1½ Hrs.	1 Hr.
Grade A Concrete*— poured solid	2	2	1½	1½	1½	1
Grade B Concrete*— poured solid	2½	2½	2	2	2	1½
Brick, back filled	3¾	3¾	3¾	2¾	2¾	2¾
Structural clay tile	4	3	3	2	2	2
Structural clay tile plastered	3	2	2	2	2	2
Gypsum—poured solid	2	2	1½	1½	1	1
Solid Gypsum block	—	—	2	2	2	2
Solid Gypsum block plastered	2	2	—	—	—	—
Hollow Gypsum block	—	3	3	3	3	3
Hollow Gypsum block plastered	3	—	—	—	—	—
Concrete block or tile	—	3	3	2	2	2
Concrete block or tile plastered	3	2	2	—	—	—
Gypsum—Vermiculite plaster on suspended metal lath	1	¾	—	—	—	—
Gypsum or Portland cement plaster on metal or wire lath	—	—	—	—	1	¾

(mix not leaner than 1:2 scratch, 1:3 brown coat by weight for gypsum plaster; or 1:3 by volume for cement plaster)

*See Section 1008.1.

GENERAL REQUIREMENTS—TABLE 1004

For the above ratings in Table 1004, protective materials shall protect flanges and portions of webs and members not otherwise protected by arches, slabs, or ceilings.

For ratings of steel floor and roof assemblies see Section 1007.

2 Hrs.

Gypsum plaster on metal lath, mixture ratio 1:2, 1:3

by weight for scratch and brown coats ¾" (a)

(a) This rating shall apply to steel beam and joist construction

not supporting bearing or masonry walls, piers, columns or trusses, and where a top slab of concrete or gypsum at least $2\frac{1}{4}$ " thick is supported on top flanges of steel beams which are protected by the ceiling, as specified, attached to the lower flanges.

THICKNESS—Except in the case of the last item in Table 1004, thicknesses refer to thicknesses of protective material before the application of plaster. Such thicknesses shall be measured from the extreme outer edge of the member, except that the thickness of protective material required at the extreme edges of lugs, brackets, wind bracing and other connections shall be not less than 1".

REINFORCEMENT—Poured protections shall be adequately reinforced with 4"x4" wire mesh weighing not less than $1\frac{1}{2}$ Lbs. per square yard or equivalent reinforcement.

MORTAR—Protective coverings of masonry units shall be solidly bedded and laid in cement, gypsum or lime-cement mortar, except that gypsum blocks shall be laid in gypsum mortar.

BONDS OR TIES—Block and tile protective coverings shall be securely anchored or bonded by wall ties or metal mesh laid in the horizontal joints, by metal clips connecting one unit to another, by outside tie wires not smaller than No. 12 B and S gauge (0.08" diameter) with at least one such tie around every course, or by means of specially designed units providing positive anchorage to the member or to other units. Outside tie wires shall in all cases be protected by at least $\frac{1}{2}$ " of mortar or plaster.

PLASTER THICKNESS—Wherever the tabulation specifies that protective materials are to be plastered, gypsum or Portland cement plaster not less than $\frac{1}{2}$ " thick shall be used except that on gypsum units, gypsum plaster only shall be used. Thickness of plaster applied to metal lath shall be measured from the back plane of the flat portion of the lath.

METAL LATH—Metal or wire lath shall meet the requirements of Section 1008.6.

SECTION 1005—FIRE-RESISTANCE RATINGS FOR REINFORCED CONCRETE COLUMNS, BEAMS, GIRDERS AND TRUSSES

Fire-resistance ratings for reinforced concrete columns, beams, girders and trusses indicated, the various thicknesses of fire protection outside of reinforcing steel shall be not less than specified in Table 1005:

TABLE 1005

Ratings for Reinforced Concrete Members
Thickness in inches outside of Reinforcing

Quality of Concrete	steel for ratings of			
	4 hrs.	3 hrs.	2 hrs.	1 hr.
Grade A Concrete*	2	2	1½	
Grade B Concrete*	3	2½	2	1½

*See Section 1008.1.

GENERAL REQUIREMENTS

Coarse aggregate shall not exceed $\frac{3}{4}$ of an inch in diameter for concrete used to meet fire-protection requirements.

Gypsum or Portland cement plaster, not less than $\frac{3}{4}$ " in thickness, applied on metal lath and in contact with the concrete, may be substituted for $\frac{1}{2}$ " of the required poured protection; provided that such poured protection shall in no case be reduced to less than 1" in thickness. Metal or wire lath used for such purpose shall conform to the provisions of Section 1008.6.

For reinforced concrete columns of 16 inch diameter and larger in size, the thickness of fire protection outside the reinforcing steel may be reduced $\frac{1}{2}$ " from that specified in the above tabulation except that in no case shall the outside protection be less than $1\frac{1}{2}$ ".

SECTION 1006—FIRE-RESISTANCE RATINGS FOR TIMBER COLUMNS

Timber columns not less than 120 Sq. In. in cross section, having cast iron, steel or concrete caps, shall have one hour fire resistant rating provided the entire assembly, with the exception of the concrete caps, is protected with $\frac{3}{8}$ " gypsum board, or equivalent.

SECTION 1007—FIRE-RESISTANCE RATINGS FOR FLOOR AND ROOF CONSTRUCTION

Fire-resistance ratings for floors and roofs of the constructions described, shall be in accordance with this section. Wood finish floors may be applied to the constructions rated below provided they meet the requirements as set forth in Section 704.2.

TABLE 1007. RATINGS FOR FLOORS AND ROOFS

Description of Construction	Fire-Resistance Rating
Reinforced Concrete	
Reinforced concrete slab with $\frac{3}{4}$ " minimum outside protection for reinforcement:	
4½" thick slab	2½ hours
4 " thick slab	2 hours
3½" thick slab	1½ hours
2½" thick slab	1 hour
Reinforced concrete slab on concrete joists not less than 4" wide and not over 30" on centers, with $\frac{3}{4}$ " minimum outside protection for reinforcement, and having plastered ceiling on metal or	

wire lath:	
2½" slab; ceiling 1" unsanded gypsum plaster	3 hours
2¼" slab; ceiling ¾" sanded gypsum plaster (mix 1:2 scratch, 1:3 brown coat)	2 hours
2" slab; ceiling same as 2 Hr. rating, or ¾" Portland cement plaster*	1½ hours
2" slab; ceiling same as 2 Hr. rating, or ¾" Portland cement plaster*	1 hour
Concrete and Tile —Tile and concrete composite construction consisting of tile fillers of concrete, gypsum or structural clay tile not less than 4" deep with reinforced concrete ribs (¾" protection for reinforcement) and concrete top slab not less than 2" thick	
	2½ hrs.
Tile and concrete composite construction as described above omitting the top slab but with gypsum plaster ceiling	
	1½ hours
Gypsum —Gypsum (poured) slab at least 3" thick and reinforced, having ¾" minimum protection for reinforcement, and a ceiling of gypsum plaster	
	2½ hours
Brick —Brick arch not less than 4" deep with a level concrete fill 2" above crown	
	2½ hours
Clay Tile —Flat arch of clay tile, 2 cell structural tile not less than 8" deep, with floor fill of incombustible material at least 2" thick and having gypsum plaster ceiling	
	2½ hours
Segmental arch of clay tile, 2 cell structural tile not less than 6" deep, laid in cement mortar, with concrete fill level with crown of arch, and having gypsum plaster ceiling	
	2½ hours
Steel Joist and Light Steel Constructions	
Reinforced concrete or gypsum slab supported on open or solid web steel joists, formed steel members or rolled steel beams located not over 30" on centers, having plaster ceilings applied on metal or wire lath attached directly to the underside of the steel supports.	
Metal lath of approved weight serving as a form for poured top slab, may be considered as reinforcement.	
Specified slab thicknesses shall be measured from the top of supporting steel members. If precast tile or slab are used they shall have joints grouted or be so constructed to provide tight end and side joints. Mortar finish shall be applied to top of 2" precast slabs to make up the designated	

thickness of top slab when it exceeds 2".

Steel Floor

Steel floor construction shall consist of sheet or strip steel formed into an integrated system of parallel steel beams which combine the function of load-bearing members and a continuous deck spanning between main supporting girders, beams or walls.

When used in fire-resistive construction, steel floors shall have a minimum of two inches (2") of concrete fill on top and shall be protected with a fire resistive ceiling of metal lath and plaster suspended from the under side.

Ratings of steel joist and light steel constructions and steel floors for various ceilings and thicknesses of top slab follow:

2½" top slab; ceiling 1" gypsum-vermiculite plaster, ratio 100 lbs. gypsum to 2 cu. ft. vermiculite or 100 lbs. gypsum to 3 cu. ft. vermiculite	4 hours
---	---------

2½" top slab; ceiling 1" unsanded gypsum plaster or ¾" gypsum-vermiculite plaster, ratio 100 lbs. gypsum to 2 cu. ft. vermiculite, or 100 lbs. gypsum to 3 cu. ft. vermiculite	3 hours
--	---------

2" top slab; ceiling 1" unsanded gypsum or ¾" gypsum-vermiculite plaster, ratio of 100 lbs. gypsum to 2 cu. ft. vermiculite, or 100 lbs. gypsum to 3 cu. ft. vermiculite	2½ hours
--	----------

2¼" top slab; ceiling ¾" sanded gypsum plaster, mix 1:2 for scratch and 1:3 for brown coat	2 hours
--	---------

2" top slab; ceiling ¾" sanded gypsum plaster, mix 1:2 for scratch and 1:3 for brown coat or ¾" portland cement and sand plaster of like mix with 15 lbs. hydrated lime and 3 lbs. of short asbestos fiber per bag of portland cement	1½ hours
---	----------

2½" top slab; ceiling 7/8" sanded gypsum plaster on metal lath, mix 1:2 for both scratch and brown coat	2½ hours
---	----------

Double wood floor (subfloor ¾" sheathing, finish floor tongue and groove) with insulating paper between, or single wood floor (or equivalent insulation) applied to steel deck; ceiling as required for 1½ hr. rating	1 Hour
---	--------

One inch nominal single wood floor on wood nailers fastened to steel deck with insulating paper cemented thereto, or one inch nominal tongue and groove single wood floor on wood nailers attached to steel joists; ceiling as required for 1½ hour ceiling	1½ hours
---	----------

Wood Joist Construction

Double wood floor (subfloor $\frac{3}{4}$ " sheathing, finish floor tongue and groove) with insulating paper between, supported on 2"x10" wood joists spaced 16" on centers and having plaster ceilings.

Ratings shall be as follows for various ceiling protections:

Ceiling— $\frac{3}{4}$ " sanded gypsum plaster, mix 1:2 for scratch and 1:3 for brown coat, or $\frac{3}{4}$ " Portland cement and sand plaster of like mix with 15 Lbs. of hydrated lime and 3 Lbs. of short asbestos fiber per bag of Portland cement. Plaster shall be applied to metal lath which shall be attached to joists as specified in Sect. 1008.5

1 Hour

Ceiling— $\frac{1}{2}$ " sanded gypsum plaster, mix 1:2 applied on $\frac{3}{8}$ " perforated gypsum lath (see Sect. 1008) which shall be nailed to joists in the manner specified in Section 1008.6. Joints of gypsum lath shall be covered with 3" strips of metal lath attached with $1\frac{1}{4}$ " No. 12 gauge nails having $\frac{1}{2}$ " heads, spaced not over 5" apart along joists and 2 nails per joist for strips perpendicular to joists

1 Hour

Ceiling—two layers of $\frac{1}{2}$ " gypsum wallboard separated by a 20 gauge, 1-inch mesh wire screen.

1 hour

*Portland Cement plaster shall be sanded not leaner than 1:3 mix by volume, with 15 Lbs. of hydrated lime and 3 Lbs. of short asbestos fiber added per bag of cement.

Steel Roof Deck Construction

(a) Steel deck covered with not less than 2-inch nominal thickness of vermiculite concrete, or equivalent, and supported on steel framing protected with a suspended ceiling of metal or wire lath and 1-inch gypsum vermiculite plaster, ratio of gypsum to vermiculite: 100 lbs. of gypsum to 2 $\frac{1}{2}$ cu. ft. of vermiculite (for scratch and brown coats).

4 hours

(b) Steel deck covered with not less than 1 $\frac{3}{4}$ -inch nominal thickness of insulation board consisting of shredded wood bonded with portland cement, or equivalent, and supported on steel framing protected with a suspended ceiling as prescribed in Item (a) above.

3 $\frac{1}{2}$ hours

(c) Steel deck covered with not less than 1 inch nominal thickness of insulation board consisting of shredded wood bonded with portland ce-

- ment, or equivalent, and supported on steel framing protected with a suspended ceiling as prescribed in Item (a) above. 3 hours
- (d) Steel deck covered with not less than 1 inch nominal thickness of insulation board consisting of felted glass fiber, or equivalent, and supported on steel framing protected with a suspended ceiling as prescribed in Item (a) above. 2 hours
- Steel deck covered with not less than 1½" nominal thickness of wood fiber-board insulation, or equivalent, and supported on steel framing protected with a suspended ceiling of metal or wire lath and 1" sanded gypsum plaster (1:2 mix for scratch and brown coats) 2 hours
- Steel deck covered with not less than 1½" nominal thickness of insulation consisting of wood fiber and a cement binder, or equivalent, and supported on steel framing protected with a suspended ceiling of metal or wire lath and ¾" sanded gypsum plaster (1:2 mix for scratch and brown coats) 2 hours
- Steel deck covered with not less than 1" nominal thickness of wood fiber-board insulation, or equivalent, and supported on steel framing protected with a suspended ceiling of metal lath and ¾" sanded gypsum plaster (1:2 mix for scratch coat and 1:3 for brown coat) 1½ hours
- Steel deck covered with not less than 1" nominal thickness of single wood sheathing (or equivalent fiber-board insulation) and supported on steel framing protected with a suspended ceiling of metal or wire lath and ¾" sanded gypsum plaster (1:2 mix for scratch coat and 1:3 for brown coat) or ¾" Portland cement and sand plaster of like mix with 15 lbs. of hydrated lime and 3 lbs. of short asbestos fiber per bag of Portland cement 1 hour

SECTION 1008—MATERIALS FOR FIRE PROTECTION

Materials specified for the fire resistance ratings of this chapter shall conform with the requirements of this section.

1008.1—CONCRETE

Concrete used for fire protection shall consist of one part Portland cement and not more than two parts of sand and four parts of approved aggregate, (not over ¾" diameter by volume suitable reinforced with wire or metal fabrics.)

Grade A Concrete is concrete in which the coarse aggregate consists of limestone, calcareous gravel, trap rock, blast furnace slag, burnt clay or burnt shale, containing not more than 10% of quartz, chert or flint.

Grade B Concrete is concrete in which the coarse aggregate consists of cinders or of material containing more than sixty per cent of siliceous material such as granite, sandstone, quartz, chert or flint.

Concrete in which the mineral composition of the aggregate is undetermined, shall be classed as Grade B. concrete.

1008.2—BRICKWORK

Bonded brickwork shall be laid in cement mortar or cement-lime mortar. Brick shall conform to the "Standard Specifications for Building Brick" of the American Society for Testing Materials (ASTM C62-49).

1008.3—CLAY TILE

Porous or semi-porous hollow clay tile shall be laid in cement mortar, cement-lime mortar or gypsum mortar. Used in non-bearing partitions, clay tile shall meet the requirements of the American Society for Testing Materials "Standard Specifications for Structural Clay Non-Load-Bearing Tile" ASTM C56-49. Clay tile used in exterior and bearing walls shall meet the requirements of the American Society for Testing Materials "Standard Specifications and Tests for Structural Clay Load-Bearing Wall Tile" ASTM C56-49.

1008.4—GYPSUM

Gypsum blocks shall contain not more than 12½ per centum by weight of binding material, shall be laid in gypsum mortar, and shall meet the American Society for Testing Materials "Standard Specifications for Gypsum Partition Tile or Block" (ASTM C52-41).

Poured Gypsum used for fireproofing and floor and roof construction shall contain not more than 12½ per cent of wood chips, shavings or fiber measured in a dry condition as a percentage, by weight, of the dry mix. Gypsum mortar shall be composed of one part gypsum and not more than three parts clean, sharp, well-graded sand, by weight.

All plaster mixes for gypsum plaster shall be measured by dry weight except gypsum-vermiculite plaster which shall be proportioned in the ratio of 100 lbs. of neat gypsum to 2 cu. ft. of vermiculite, or 100 lbs. of neat gypsum to 3 cu. ft. vermiculite.

1008.5—GYPSUM LATH

Gypsum lath shall comply with the provisions of the American Society for Testing Materials Standard Specifications for Gypsum Lath (ASTM Designation C37-42). Perforated gypsum lath shall have perforations not less than ¾" in diameter, with one perforation for not more than 16 square inches of lath surface.

Gypsum lath shall be nailed to wood studs or joists in all constructions required to be fire resistive, with No. 13 gauge $1\frac{1}{2}$ ", $\frac{3}{8}$ " flat head blued nails at intervals not exceeding 4" on centers or equivalent attachment.

1008.6—METAL OR WIRE LATH

Wherever metal, wire lath and plaster are used as required protection against the spread of fire, the weight of lath shall be not less than 2.5 Lbs. per square yard when used in vertical position, and not less than 2.75 Lbs. per square yard when used in horizontal position. Mesh shall not be larger than $2\frac{1}{2}$ to an inch, or equivalent.

Weight tags shall be left on all metal until inspected and approved by the Building Official.

Metal lath for ceilings below wood joists in construction which is required to be fire resistive shall be attached with $1\frac{1}{2}$ ", 11 gauge $7/16$ " head barbed roofing nails spaced at intervals not to exceed 6" on centers, or equivalent attachment.

Wherever the word wire lath is used in fire resistive plastering it shall not preclude the use of paper back wire lath. Whenever paper back wire lath is used it shall be in accordance with fire test No. TG 3619-50, FR 1835 of the U. S. Department of Commerce.

1008.7—CONCRETE BLOCKS

Hollow concrete tile or blocks shall be units designated for wall construction and shall meet the requirements of the "Standard Specifications and Tests for Load Bearing Concrete Masonry Units" (ASTM C90-44) of the American Society for Testing Materials.

1008.8—VERMICULITE

Vermiculite, when used as an aggregate with plaster, shall conform in particle size to ASTM Standard Specifications for Sand for Use in Plaster (C35-39). The weight shall be not less than $7\frac{1}{2}$ nor more than 10 lbs. per cu. ft., as determined by measurement in a cubic foot box using the shoveling procedure as outlined in ASTM 'Standard Methods of Test for Unit Weight of Aggregate' (C29-42)."

CHAPTER XI

EXIT REQUIREMENTS

SECTION 1101—GENERAL PROVISIONS

In every building hereafter erected, exits shall comply with the minimum requirements of this Chapter except those exits which are not required or which are not accessible for public use.

Where unusually hazardous conditions exist, additional exit facilities shall be provided as ordered by the Building Official, when necessary to assure the safety of the occupants.

No building shall hereafter be altered so as to reduce the number or width of exits to less than required by this Chapter nor shall any change of occupancy be made in any building unless such building conforms with the requirements of this Chapter.

For exit requirements in Group E, Assembly occupancies, see Sections 512.5 to 512.18, inclusive.

SECTION 1102—PERMISSIBLE EXITS

Exits shall consist of continuous means of egress to the exterior of a building by stairways, escalators, horizontal exits, doorways providing direct exit to a street or to an exterior open space leading to a street, passageway, or ramps, conforming with the requirements of this Chapter and providing that all such exits shall be enclosed and separated from the rest of the building as provided in Section 701. Elevators shall not be considered as providing exit facilities required by this chapter except as provided in Section 1115.

Stairways, ramps and passageways used for required exits shall be of non-combustible construction except where otherwise specifically permitted by Sections 1108, Stairways; 1111, Passageways; and 1112, Ramps.

SECTION 1103—NUMBER AND ARRANGEMENT OF EXITS

1103.1—ARRANGEMENT

Exits shall be so located that the distance from an exit to the most remote point in the floor area, room, or space served by them (in office buildings, hotels and apartments where floor areas are subdivided into small spaces or rooms, the distance of travel to an exit shall be measured from the corridor entrance to such rooms or spaces)

measured along the line of travel, shall be not more than that specified below, except that where sprinklers are installed throughout a building, maximum distance of travel to an exit may be thirty-three and one-third ($33 \frac{1}{3}$) per cent greater than these tabular values, provided sprinkler equipment is not required by this Code for such building:

OCCUPANCY	Maximum Distance of Travel to an Exit. (Lin. Ft.)
Group A, Residential	100
Group B-1, Business, Offices	150
Group B-2, Business, Mercantile	100
Group C, Schools	75
Group D, Institutional	85
Group E, Assembly	100
Group F, Storage	100
Group G, Industrial	100
Group H, Hazardous	75

1103.2 — NUMBER OF EXITS

Every room or floor space of a building, occupied by seventy-five (75) persons or more, or occupied by a Group H, Hazardous occupancy, shall have not less than two (2) doorways or independent exits, located as remote as practicable from each other.

There shall be not less than two (2) exits or two (2) exit stairways serving every floor area, except that in the following cases there may be access to one (1) exit provided such exit is enclosed by construction as specified in Section 701, but affording in no case less than 1-hour fire resistance.

Where one exit is permitted:

In Group A, Residential Buildings having no floor over three thousand five hundred (3,500) Sq. Ft. in area, of Type I, Fireproof or of Type II, Fire Resistive construction, or of other types of construction provided not over two stories in height. Maximum distance of travel to an exit shall not exceed 30 feet.

In Group B, Business Buildings having no floor area over three thousand five hundred (3,500) Sq. Ft. in area, of Type I, Fireproof or of Type II, Fire Resistive construction, or of other types of construction provided not over two stories in height. Maximum distance of travel to an exit shall not exceed 50 feet and occupant content shall not exceed 40 persons above the street floor.

Sufficient exit facilities shall be provided so that the aggregate capacity of all such exits, determined in accordance with this Chapter, shall be not less than the actual number of persons in the area served, but in no case less than the occupant content as determined from Sect. 1105.

It shall be unlawful to occupy any part of a building by a greater number of persons than that for which exit capacity, as prescribed in this Chapter, has been provided.

SECTION 1104—SPECIAL EXIT REQUIREMENTS

In Group D Institutional occupancies every area housing bed-ridden patients shall have access to a horizontal exit, ramp or passageway, leading to the exterior and having a width of not less than five (5) feet, located within a distance of travel not exceeding one hundred (100) feet or not exceeding one hundred fifty (150) feet if the building is equipped with sprinklers throughout. Corridor dead-ends shall not exceed ten (10) feet in length.

Exits for Group E Assembly occupancies shall be as required by Sections 512.8 to 519.19.

In rooms in which are located steam boilers, oil-fired incinerators, or apparatus using or producing gas or vapor, the maximum distance of travel to an exit shall not exceed 20 feet. Where two exits are required one may have a width of not less than two feet no inches (2'0").

SECTION 1105—EXIT CAPACITY REQUIREMENTS

SECTION 1105.1—OCCUPANT CONTENT

For determining the exits required, the minimum number of persons or the occupant content of any floor area shall in no case be taken less than specified below:

Occupancy	Minimum Occupant Content
	Floor Area Per Person
Group A—Residential	125 Sq. Ft.
Group B—Stores—street floor and sales basements	30 Sq. Ft.
—upper sales floors	60 Sq. Ft.
Office Buildings and other Group B occupancies	100 Sq. Ft.
Group C—Schools—classrooms and recreation	20 Sq. Ft.
—laboratories, museums, libraries, and similar rooms	30 Sq. Ft.
—shops, vocational, administrative rooms	100 Sq. Ft.
—gymnasiums	15 Sq. Ft.
Group D—Institutional	125 Sq. Ft.
Group E—Assembly—See Sect. 408.3.	
Group F—Storage	300 Sq. Ft.
Group G—Industrial	100 Sq. Ft.
Group H—Hazardous	100 Sq. Ft.

1105.2—CAPACITY OF STAIRWAYS

The capacity of exit stairways constructed in accordance with Section 1108 shall not exceed that specified below.

Any given stairway meeting the requirements of this Chapter,

may be used as a required exit from all floors which it serves. If, for example, three (3) stairways are required to serve the third floor of a building and a like number are required for the second floor, the total number of stairways required shall be three, not six.

There shall be not less than two (2) exits, or exit stairways, serving each floor, except as otherwise permitted in Sections 1103.2 and 1104.

MINIMUM EXIT STAIRWAY REQUIREMENTS

Occupancy for All Types	Max. No. of Occupants Per Floor Per 44" Wide Stairway	Max. Allowable Floor Area Per Floor Per 44" Wide Stairway—Sq. Ft.
Group A—Residential	60	7,500
Group B—Stores, Street Floor and Sales Basement	120	3,600
Group B—Stores, Upper Sales Floor	120	7,200
Group B—Office Buildings and Others	120	12,000
Group C—Schools *	120	*
Group D—Institutions	60	7,500
Group E—Assembly	See Section 512.5 to 512.13	
Group F—Storage	120	36,000
Group G—Industrial	120	12,000
Group H—Hazardous	60	6,000

*For rooms with seventy-five (75) or more occupants, See Chapter IV—Assembly Occupancy and detail requirements in Section 512.5 to 512.13.

*See Sect. 1105.1 for occupant content of rooms in schools
Refer 514 for Churches.

1105.2 — CAPACITY OF STAIRWAYS

The maximum exit capacity of exit stairways complying with the requirements of Section 1108 but having a minimum width greater than forty-four (44) inches shall be determined as follows:

Minimum stairs width 44" to 56"—Capacity same as 44" wide stairway	
Minimum stairs width 56" to 66"—Capacity 25% larger than 44" wide stairway	
Minimum stairs width 66" to 78"—Capacity 50% larger than 44" wide stairway	
Minimum stairs width 78" to 88"—Capacity 75% larger than 44" wide stairway	
Minimum stairs width 88" and over—Capacity 100% larger than 44" wide stairway	

1105.3 — CAPACITY OF DOORWAYS AND HORIZONTAL EXITS

The exit capacity of a doorway or a horizontal exit complying with the requirements of this Chapter, shall be based on the clear width of the opening between jambs, and shall not exceed:

Doorway Width	Capacity Number of Occupants
Clear Width—36" to 44"	150
Clear Width—44" to 56"	200
Clear Width—56" to 66"	250
Clear Width—66" to 78"	300
Clear Width—78" to 88"	350
Clear Width—88" or over	400

Doorways or horizontal exits of sufficient number and width shall be provided to have capacity not less than the actual number of persons to be accommodated within the floor area served, except that in no case shall the number of occupants be taken less than the occupant content as figured from the gross floor area in accordance with Section 1105.1, occupant content.

The aggregate width of exit doorways or exit openings through which an exit stairway discharges shall be at least equal to the width of that stairway. If there is more than one (1) such tributary exit stairway, the exit doorways shall be at least equal in aggregate width to three-fourths ($\frac{3}{4}$) the combined width of such exit stairways, except as otherwise specified for street floors. The width of exit doorways shall be further increased to provide for any additional persons on the floor served by such exit doorways.

Street floor exit doorways shall aggregate the width of stairways, ramps, and escalators, serving upper floors and basements, and shall have the additional width necessary to provide for the occupants accommodated on the street floor.

1105.4 — CAPACITY OF PASSAGEWAYS AND CORRIDORS

Width and exit capacity of passageways and corridors shall be not less than that required for the exit doorways leading from them in the direction of travel to the exterior. See Section 1105.3 and Section 1111.

1105.5 — CAPACITY OF RAMPS

Width and exit capacity of ramps shall be the same as specified for stairways. See Section 1105.2 and Section 1112.

1105.6 — CAPACITY OF ELEVATORS

For the purpose of meeting the exit requirements of this Chapter the exit capacity of one (1) passenger elevator shall in no case be taken as more than twenty (20) persons or the capacity of the elevator. See requirements of Section 1115 relative to use of elevators as required exits.

1105.7 — CAPACITY OF ESCALATORS OR MOVING STAIRS

The width and exit capacity of escalators complying with the requirements of Section 1116 shall be as specified for stairways except that the maximum width of escalator shall not exceed 48".

SECTION 1106—EXIT ENCLOSURES

Exits required by this Chapter shall be completely enclosed and protected from the rest of the building, as required by Section 701.

SECTION 1107—EXIT OUTLETS

Every required exit shall provide continuous and protected egress discharging finally into a street, an open space leading to a street, or into an exit court or passageway leading to a street or into an approved open space having access to a street.

Such exit courts or passageways shall be enclosed with construction providing the degree of fire resistance specified in Section 701 but in no case less than 2 hours fire resistance.

The width of such courts or passageways shall be not less than the width of the exits tributary thereto. There shall be no reduction of width in the direction of exit travel.

Slope of floors in exits shall not exceed one in ten.

SECTION 1108—STAIRWAY CONSTRUCTION

1108.1 — GENERAL

Interior stairways shall be constructed of non-combustible materials throughout in the following buildings:

All buildings of Type I, Fireproof and of Type II, Fire Resistive construction.

All buildings of Group C, Schools over 2 stories, of Group D, Institutions, and theaters of Group E-1 Assembly Occupancy and Group E-2 over 2 stories.

All other buildings four (4) stories or more in height, or occupied by more than forty (40) persons above or below the first story at street or grade level.

All exterior stairs or stairways in buildings over two stories in height shall be constructed entirely of non-combustible materials.

When treads or landings are of slate, marble, stone, or composition, they shall be suitably supported for their entire length and width.

All such stairways shall have solid risers.

Stairs constructed of wood shall be firestopped as specified in Section 705.

Except in 1- and 2-family dwellings which are less than three (3) stories in height, no closet shall be located beneath stairs that are in whole or part of combustible construction; such space shall be left entirely open and free from encumbrance.

Except in 1- and 2-family dwellings the underside of stairways, if of combustible construction, shall be protected to provide not less than 1-hour fire resistance.

1108.2 — BASEMENT STAIRS

(a) In Group E Theaters and Assembly occupancies, no exit stair or stairway from a lower story shall lead to an exit doorway serving an exit stair or stairway from an upper story.

(b) In no case shall a stair or stairway from a lower story lead to an exit doorway serving an exit stair or stairway from an upper story, unless such stair or stairway from below is separated at its upper end from the stair or stairway from above by partitions of 2-hour fire resistance.

1108.3 — TREADS AND RISERS

Treads and risers of required stairs shall be so proportioned that the sum of two (2) risers and a tread, exclusive of projection or nosing, is not less than twenty-four (24) inches nor more than twenty-five (25) inches. The height of riser shall not exceed seven and three-quarter ($7\frac{3}{4}$) inches in height, and treads, exclusive of nosing, shall be not less than nine (9) inches wide. Every tread less than ten (10) inches wide shall have a nosing, or effective projection, of approximately one (1) inch over the level immediately below that tread.

Treads shall be of uniform width and risers of uniform height in any one flight of stairs.

The use of winders and/or spiral stairways, is prohibited in stairways serving as required exits.

1108.4 — LANDINGS

No flight of stairs shall have a vertical rise of more than twelve (12) feet between floors or landings; provided that in stairways serving as exits in buildings of Group E Theater and Assembly occupancies, such vertical rise shall not exceed eight (8) feet between landings.

The length and width of landings shall be not less than the width of stairways in which they occur.

In buildings of Group E Assembly occupancies, flights of less than three risers shall not be used in stairways, interior or exterior, passageways, at entrance or elsewhere in connection with required exits. To overcome lesser differences in level, gradients not exceeding one (1) in ten (10) may be used.

1108.5 — HANDRAILS

Except where permitted in aisles, stairs shall have walls or well-secured balustrades or guards on both sides, and shall have handrails on both sides except that stairs of less than forty-four (44) inches in width may have handrails on one side only.

When the required width of a flight of stairs exceeds eighty-eight (88) inches, one or more intermediate handrails, continuous between landings, substantially supported and terminating at the upper end in newels or standards at least six (6) feet high, shall be provided and there shall be not more than sixty-six (66) inches between such adjacent handrails.

Stairs serving as required exits, shall be at least forty-four (44) inches wide except that in 1- or 2-family dwellings, in Group B, Business occupancies accommodating not over thirty-five (35) persons and for stairs leading to roofs, not occupied, the width may be thirty-six (36) inches. All such widths shall be clear of all obstructions except that handrails attached to walls may project not more than three and one-half (3½) inches at each side within the required width.

Width of stairs shall not decrease in the direction of exit travel.

SECTION 1109—FIRE ESCAPES

Fire escapes, or outside stairs not meeting the requirements of this chapter, shall not be permitted except as approved by the Building Official for existing buildings not over four (4) stories in height, where additional exits are necessary and conditions do not permit the use of more adequate exit facilities.

Exterior fire escapes constructed by the direction of the Building Official on buildings heretofore erected, shall conform so far as possible with the requirements of this chapter. Fire escapes shall be constructed of non-combustible material and shall be arranged and located so that they can readily be reached by occupants of the building and so that safe egress is provided at the foot of the fire escape.

Wall openings adjacent to fire-escapes shall be protected with approved fire resistive windows or doors.

Metal Guards—Exterior stairways, unless otherwise enclosed by non-combustible materials, shall be provided throughout with metal mesh or other rigid guards at least four (4) feet high on each unenclosed side of such stairway. All glass used in the construction of such enclosures shall be wired glass.

SECTION 1110—DOORWAYS

Every exit doorway shall open into an enclosed stairway, a horizontal exit, a fire protected corridor or passageway, meeting the requirements of this chapter and providing continuous protected egress to a street, or to an exterior open space leading to a street.

No exit doorway shall be less than thirty-six (36) inches in width except that in Group D, Institutional occupancies, doorways serving as exits for areas housing bedridden patients shall be not less than sixty (60) inches in width.

Exit doors that are hinged shall swing in the direction of exit and shall not obstruct the travel along any required exit, except that doors swung flat against the wall may project not more than six (6) inches. No door shall at any point in its swing reduce the required width of an exit stairway or landing to less than thirty-six (36) inches nor interfere with full use of the stairs.

No exit doorway shall open immediately upon a flight of stairs. A landing of at least the width of door shall be provided.

Exit doorways shall open from the inside without the use of a key, except in places of detention where approved releasing devices shall be provided for emergency use.

Exit doors of Group C, School and Group E, Assembly occupancies shall be equipped with approved latches (fire exit bolts) and approved releasing devices operating in the direction of exit travel and extending not less than two-thirds ($2/3$) of the door width, which release when pressure of fifteen (15) lbs. or less is applied.

For required width of doorways serving exit stairways and the exit capacity of doorways, see Section 1105.3.

Revolving Doors—Revolving doors shall not be used as required exits unless exit doors of required width are installed adjacent thereto. Revolving doors shall be of approved collapsible type.

Special Doorway Requirements—No door, when opening or when fully open shall project beyond the building line. (See Chapter XXII, Use of Public Property). Every door used as a means of egress or ingress in cafes, restaurants, or in any building of Group E, Assembly Occupancy, shall be considered as an exit doorway and shall meet all the requirements as set forth in this section.

SECTION 1111—PASSAGEWAYS AND CORRIDORS

Exit corridors and exit passageways shall be of width not less than the aggregate required width of the exit doorways leading from them in the direction of travel to the exterior.

Exit passageways shall be enclosed and protected from the rest of the building by construction of not less than 2-hour fire resistance. Where stairways discharge through fire resistive passageways such passageways shall be not less than eight (8) feet in height.

Corridors in School occupancies shall be at least eight (8) ft. wide.

SECTION 1112—RAMPS

The width and enclosure of exit ramps shall be as required for exit passageways. The slope of a ramp shall not exceed one (1) in ten (10).

Surface of ramps shall be of non-slip material.

Exit ramps shall be of non-combustible construction except as otherwise permitted for stairs.

Ramps shall comply with all requirements for stairways so far as those requirements are applicable.

SECTION 1113—HORIZONTAL EXITS

A horizontal exit is a horizontal passageway through a fire wall or through a 2-hour fire resistive partition into another building or into another section of the same building. A horizontal exit may serve as a required exit only when it meets all the requirements of this section.

The width of horizontal exits shall be not less than required for exit doorways. The exit capacity of horizontal exits shall be as specified in Section 1105.2.

Horizontal exits shall be equipped with at least one (1) approved fire door of a self-closing type. Door openings shall be protected as specified in Section 703.

Floor area on either side of a horizontal exit shall be sufficient to hold the occupants of both floor areas served, allowing not less than three (3) Sq. Ft. net clear area per person.

The area into which a horizontal exit leads shall be provided with exits adequate to meet the requirements of this Chapter, at least one of which shall lead directly to the exterior.

Where there is a difference of level between connected areas, ramps, not steps, shall be used, meeting the requirements of Section 1112.

Doors in horizontal exits shall be kept unlocked and unobstructed.

SECTION 1114—EXIT TO ROOF

In all buildings over three (3) stories in height, of other than Type I, Fireproof or Type II, Fire Resistive construction, one enclosed exit stairway shall be continued from street grade level to or through roof level except where roofs have a slope greater than one (1) in four (4). Such stairway shall be marked at street and floor levels with a sign indicating that it continues to the roof.

Where roofs are used for roof gardens or for other purposes, however, stairways shall be provided as required for such use or occupancy.

Where no stairway extends to the roof, scuttles shall be provided of size not less than two (2) feet by three (3) feet, giving access to the roof.

SECTION 1115—ELEVATORS

Elevators, arranged with two (2) or more elevators in a common shaft, may be accepted as one of two required means of exit for office buildings of Type I Fireproof or of Type II Fire Resistive construction only, provided such use is approved by the Building Official, but only two (2) elevators in such shaft shall be counted for exit purposes.

Elevator shafts whether included as required exits or not shall be enclosed and protected from the rest of the building as specified in Section 701.

Elevators shall not be located in a common enclosing shaft with an exit stairway.

Elevators constituting required means of egress shall discharge at the street floor into a fire resistive corridor or passageway which shall lead directly to the street.

Elevators shall conform with the requirements of the Safety Code for Elevators of the American Standards Association (ASA-A17.1), unless otherwise specified.

Exit capacity of elevators shall not exceed that specified in Section 1105.6.

SECTION 1116—ESCALATORS OR MOVING STAIRS

Only escalators of the horizontal tread type, which normally operate in the direction of exit travel shall be used as a required means of exit. Except in Group C, School occupancies, such escalators may be used as required exits provided they comply with all the requirements applying to exit stairways and are enclosed and protected from the rest of the building as required for exit stairways.

Unless otherwise specified, escalators shall comply with the requirements for escalators in the Safety Code for Elevators, Dumbwaiters and Escalators (ASA-A17.1), of the American Standards Association.

No individual escalator unit shall have a vertical travel of more than two (2) stories or thirty-five (35) feet, or a width exceeding forty-eight (48) inches.

For exit capacity of escalators see Section 1105.7.

SECTION 1117—EXIT SIGNS

Exits shall be indicated by approved signs or lights at all times when the building is occupied.

Every exit in Group E Assembly occupancies and every other exit serving more than one hundred (100) persons shall be marked with illuminated signs as provided in Section 512.16.

Where exit lights or signs or the exits themselves are not visible from the exit approach, directional signs indicating the way of egress shall be provided. The level at which there is direct exit to the exterior shall also be clearly indicated.

Lighting of exit signs shall be from a source independent of the general building lighting in buildings of Group E, Assembly occupancy in department stores having over five thousand (5,000) Sq. Ft. area on any one sales floor, in hotels with sleeping accommodations for more than one hundred (100) persons and in Group D, Institutional occupancies.

SECTION 1118—ILLUMINATION OF EXITS

Exits shall be illuminated at all times when the building is occupied with light of not less than one foot candle intensity at the floor level.

Artificial lighting when necessary to meet the requirements of this Section, shall be from a source independent of the general building lighting in buildings of Group E, Assembly occupancy, of Group D, Institutional occupancy, in hotels with sleeping accommodations for more than one hundred (100) persons, and in department stores of over five thousand (5,000) Sq. Ft. area on any one sales floor.

SECTION 1119—FIRE ALARM

An approved fire alarm system shall be installed in every building (except dwellings and apartments) used as sleeping quarters by twenty (20) or more persons; in every building used above or below street floor by forty (40) or more persons, or used above the second floor or in sub-basements by twenty (20) or more persons; and in buildings of Group H, Hazardous occupancies.

CHAPTER XII

MINIMUM DESIGN LOADS

SECTION 1201—GENERAL

Every building and structure shall be of sufficient strength to support the imposed live, dead and wind loads and impact loads, if any, without exceeding, in any of its structural elements, the stresses prescribed elsewhere in this code.

SECTION 1202—DEAD LOAD

The dead load of a building or other structure is the weight of all permanent construction, such as floors, roofs, permanent partitions, stairways, and walls. (See Appendix for weights of construction materials).

SECTION 1203—LIVE LOADS

SECTION 1203.1 (a)—FLOOR LOADS

Uniformly Distributed Loads—The live loads assumed for purposes of design shall be the greatest loads that probably will be produced by the intended uses and occupancies; provided that the minimum live loads to be considered as uniformly distributed shall be as given in the following table.

OCCUPANCY	Minimum Live Loads Lbs. Per Sq. Ft.
Apartments	40
Armories	150
Assembly Places—Fixed Seats	50
Assembly Places—Movable Seats	100
Balconies and Galleries—Fixed Seats	60
Balconies and Galleries—Movable Seats	60
Cornices	60
Corridors, Public	100
Dance Halls	120
Drill Rooms	150
Driveways and Yards	250**
Dwellings	40
One-Story Dwellings	30
Exterior Balconies	100
Fire Escapes	100
Garages and Trucking Spaces	120*
Gymnasiums, Main Floor and Balcony	100

Hospitals—Wards and Rooms	40
Hotels—Guest Rooms and Private Corridors	40
Libraries—Reading Rooms	60
Libraries—Stack Rooms	125
Manufacturing — Light	100
Manufacturing — Heavy	150
Offices	50
Printing Plants—Press Room	150
Printing Plants—Composing and Linotype Rooms	100
Public Rooms	100
Rest Rooms	50
Reviewing Stands and Bleachers	100
Roof Loads	(See Sections 1203.2 and 1205.3)
Schools—Class Rooms, including Sunday Schools	40
Sidewalks	200**
Skating Rinks	100
Stairways, Public	100
Storage — Light	125
Storage — Heavy (Load to be determined from proposed use or occupancy, but never less than)	250
Stores—Retail (Light Merchandise)	75
Stores—Wholesale (Light Merchandise)	100
Theaters	
Corridors, Lobbies, and Standing Space	100
Orchestra Floor and Aisles	50
Balconies	50
Stage Floor	150

*Design shall provide for maximum wheel loads. See Section 1203.1 (d) Concentrated Loads.

**See also Section 1203.3 (a) Sidewalks.

1203.1 (b)—ITEMS NOT SPECIFICALLY COVERED

For occupancies not listed above, the live load shall be approved by the Building Official.

1203.1 (c)—PROVISION FOR PARTITIONS

The actual weight of all permanent partitions shall be included in the dead load. Where partitions are likely to be used, although not definitely located, or where they are likely to be shifted, twenty (20) pounds per square foot shall be added to the dead load in the areas supporting them, except in the case of light partitioning.

1203.1 (d)—CONCENTRATED LOADS

In the design of floors, probable concentrated loads shall be considered. Where such loads may occur, the supporting beams, girders and slabs shall be designed to carry either the concentrated loads or the live load described in Section 1203.1 (a), whichever produces the greater stresses.

1203.1 (e)—REDUCTION OF LIVE LOAD

No reduction shall be applied to the roof live load.

No reduction of the live load shall be allowed in the design of any slabs, or joists.

In designing a column, girder, truss, wall, pier or foundation carrying more than one floor, the live loads of the floors which are supported by such members may be reduced, except in buildings used for storage or warehouse purposes. The reduced load shall be figured over the entire tributary floor area, and shall be not less than the following percentages of the live load for which such floors were designed:

100 per cent for members carrying one (1) floor.

90 per cent for members carrying two (2) floors.

80 per cent for members carrying three (3) floors.

and at corresponding decreasing percentages for each successive floor. In no case, however, shall the load be less than seventy per cent of the live load for any floor in industrial buildings, stores or garages, or fifty per cent for any floor in buildings of occupancies other than those for which specific provision is made herein.

Except as above provided, beams, girders and trusses shall be designed to support the full dead and live loads; provided that in buildings other than those used for storage or warehouse purposes, beams, girders or trusses carrying three hundred square feet or more of tributary floor area may be designed to carry eighty-five (85) per cent of the live load and the full dead load. This load reduction shall not be used in addition to the above reductions.

1203.1 (f)—RESTRICTIONS ON LOADING

It shall be unlawful to place, or cause or permit to be placed, on any floor or roof of a building or other structure a load greater than is permitted by these requirements.

1203.2—ROOF LIVE LOADS

Where the rise is less than thirty degrees (30°), roofs shall be designed for a vertical live load of not less than twenty (20) pounds per square foot of horizontal projection applied to any and all slopes; when the rise is greater than thirty degrees (30°) the roof shall be designed for wind load only.

Design requirements for wind pressures shall be as specified in Section 1205.3.

Roofs intended for use as floors, shall be designed for the floor live load, determined by the intended occupancy, Table 1203.1.

The foregoing provisions of this section shall not apply to glazed greenhouse roofs.

1203.3—OTHER LIVE LOADS

SIDEWALKS—Sidewalks shall be designed to carry either a uniformly distributed load of two hundred (200) pounds per square foot or a concentrated load of eight thousand (8,000) pounds on a space two and one-half (2½) feet square and placed in any position, whichever will produce the greater stresses. (This does not apply to sidewalks on grade).

1203.4—IMPACT AND CRANE RUNWAYS

All moving loads shall be increased by not less than twenty-five (25) per cent to provide for impact except that supports for elevators shall provide for one hundred (100) per cent increase of live load.

The lateral force on crane runways to provide for the effect of crane trolleys shall be not less than twenty-five (25) per cent of the lifted load plus weight of the crane trolley but exclusive of other parts of the crane, applied at the top of rail, one-half (½) on each side of runway, and considered as acting in either direction normal to the runway rail. The longitudinal force on crane runways shall be taken as not less than twelve and one-half (12½) per cent of the wheel loads of the crane, applied at top of rail.

1203.5—LOAD TESTS

The Building Official may require a load test of any construction whenever there is reason to question its safety for the intended use. Such tests are to be made at the expense of the owner or his agent. The construction shall sustain a superimposed load equal to twice the design live load and shall recover at least seventy-five (75) per cent of its maximum deflection within twenty-four (24) hours after the load is removed.

SECTION 1204—SPECIAL LOADS

1204.1—SOIL PRESSURES ON BASEMENT WALLS AND FLOORS

In the design of basement walls and similar approximately vertical structures below grade, provisions shall be made for lateral pressure of adjacent soil. Due allowances shall be made for possible surcharge from fixed or moving loads.

In the design of basement floors and similar approximately horizontal constructions below grade, the upward pressure of water, if any, shall be taken as the full hydrostatic pressure applied over the entire area. The hydrostatic head shall be measured from the underside of the construction.

1204.2—RAILINGS

Stairway railings, both exterior and interior shall be designed to resist a horizontal thrust of twenty (20) pounds per linear foot applied at the top of the railing.

Balcony railings, both exterior and interior, shall be designed to resist a horizontal thrust of fifty (50) pounds per linear foot applied at the top of the railing.

1204.3—SUPPORTS FOR WALKWAYS

Where walkways are to be installed above ceilings, supports shall be designed to carry a load of two hundred (200) pounds occupying a space two and one-half (2½) square feet, so placed as to produce maximum stresses in the affected members.

SECTION 1205—WIND LOADS

1205.1—MINIMUM DESIGN LOADS

Buildings or other structures shall be capable of withstanding the horizontal loads shown in the following table, and applied in each zone, allowing for wind from any direction. The first height zone shall be measured above the average level of the ground adjacent to the building and the subsequent height zones shall be added progressively upward to the overall height of the building.

DESIGN WIND PRESSURE FOR VARIOUS HEIGHT ZONES OF BUILDINGS OR OTHER STRUCTURES

Height Zone Ft.	Horizontal Loads	
	Lb./Sq. Ft.	
	For Southern Inland Regions	For Southern Coastal Regions*
Less than 30	10	25
31 to 50	20	35
51 to 99	24	45
100 to 199	28	50
200 to 299	30	50
300 to 399	32	50
Over 400	40	50

*Coastal regions is that area lying within 125 miles of the coast and subject to hurricanes, tropical disturbances and occasional winds attaining exceptionally high wind velocities.

1205.2—EXTERIOR WALLS

Every exterior wall shall be capable of withstanding the loads specified in the above table, acting either inward or outward.

1205.3—ROOFS—WIND LOADS

The roofs of all buildings or other structures shall be designed to withstand loads acting outward normal to the surface equal to one and one-quarter (1¼) times the horizontal loads specified for the corresponding height zone in which the roof is located. The height is to be taken as the mean height of the roof structure above the average level of the ground adjacent to the building or other

structure. The load is to be applied over the entire roof.

Roofs with slopes greater than thirty degrees (30°) shall withstand resulting loads acting inward normal to the surface equal to those specified for the height zone in which the roof is located, the load to be applied to the windward slope only.

Overhanging eaves and cornices shall be capable of withstanding upward loads equal to twice those specified.

Adequate anchorage of the roof to the walls and columns and of walls and columns to the foundations shall be required in all cases.

1205.4—CHIMNEYS

Chimneys of circular cross section shall be capable of withstanding sixty (60) per cent of the loads specified. Chimneys of square or rectangular cross section shall be capable of withstanding the full loads specified.

1205.5—SIGNS

Ordinary solid signs erected on ground level shall be capable of withstanding a load of fifteen (15) pounds per square foot. Solid signs on the roofs of buildings or other structures shall be capable of withstanding the loads specified in Section 1205.1 corresponding to the height of the center of the sign. Signs in which the open area is less than twenty-five (25) per cent of the gross area shall be considered to be solid signs and the gross area shall be used in computing the load.

Open signs erected at ground level shall be capable of withstanding a pressure of thirty (30) pounds per square foot, applied to the projected area of the members. Open signs on the roofs of buildings or other structures shall be capable of withstanding twice the loads specified in Section 1205.1 corresponding to the height of the center of the sign, applied to the projected area of the members.

1205.6—OTHER STRUCTURES

The Building Official may require evidence to support the values of the wind load used in the design of structures not specifically covered by this section.

1205.7—SHIELDING AND UNUSUAL EXPOSURES

No allowance shall be made for the shielding effect of other buildings or structures.

If the building or other structure is on an ocean promontory, or in any other location considered by the Building Official to be unusually exposed, higher wind loads may be specified by the Building Official.

1205.8—OVERTURNING MOMENT

The overturning moment due to the wind load shall not exceed sixty-six and two-thirds ($66\frac{2}{3}$) per cent of the moment of stability of the building or other structures due to the dead load only, unless the building or other structure is anchored to its foundations so as to resist the excess overturning moment without exceeding the allow-

able working stresses for the materials used.

1205.9—STRESSES DURING ERECTION

Provision shall be made for wind stresses during erection of a building or other structure.

SECTION 1206—SEATING CAPACITY POSTED

Signs stating the maximum seating capacity shall be conspicuously posted by the owner of the building in each assembly room, auditorium or room used for a similar purpose where fixed seats are not installed. It shall be unlawful to remove or deface such notice or to permit more than this legal number of persons within such space.

SECTION 1207—OCCUPANCY PERMITS FOR CHANGED LOADING

Plans for other than residential buildings filed with the Building Official with applications for permits shall show on each drawing the live loads per square foot of area covered, for which the building is designed, and occupancy permits for buildings hereafter erected shall not be issued until the floor load signs, required by Section 110, have been installed. No changes in the occupancy of a building now existing or hereafter erected shall be made until a revised occupancy permit has been issued by the Building Official certifying that the floors are suitable for the loads characteristic of the proposed occupancy. (See Section 109).

CHAPTER XIII FOUNDATIONS

EXCAVATIONS, FOOTINGS AND FOUNDATIONS

SECTION 1301—EXCAVATIONS

1301.1 — GENERAL

When excavating for buildings or excavations accessory thereto, such foundations shall be properly assured against any danger to life and property. Permanent excavations shall have retaining walls of sufficient strength made of steel, masonry, or reinforced concrete to retain embankments together with any surcharged loads. Excavations for any purpose shall not extend within one (1) foot of the angle of repose or natural slope of the soil under any footing or foundation, unless such footing or foundation is first properly underpinned or protected against settlement.

1301.2 — SUPPORT OF ADJOINING BUILDINGS AND STRUCTURES

When an excavation extends not more than 10 feet below the established curb grade nearest the point of excavation under consideration, the owner of any adjoining building or structure, the footings or foundations of which are to be underpinned or protected under the requirements of this section, shall be notified in writing by the one causing the excavation to be made. The owner of the adjoining structure or building shall be afforded the necessary license to enter the premises where the excavation is to be made, and at his own expense, shall provide the necessary underpinning or protection.

Notice to the owner of adjoining buildings or structures shall be served at least 10 days before an excavation is commenced, and it shall state the depth and location of the proposed excavation.

When an excavation extends more than 10 feet below the established curb grade nearest the point of excavation under consideration, the one causing the excavation to be made, if given the necessary license to enter the adjoining premises, shall provide at his own expense the underpinning and protection required by that part of the excavation which extends to a depth greater than 10 feet below the established curb grade nearest the point of excavation under consideration, whether or not the existing footings or foundations extend to the depth of 10 feet or more below curb grade; or he may shore and brace the sides of his excavation so as to prevent effectively any soil movement into his excavation. If permanent lateral support is provided, the method used must satisfy requirements of the Building Official. If the necessary license is not afforded the person causing the excavation to be made, it shall be the duty of the owner failing to afford such license to provide the required underpinning or protection, for which purpose he shall be afforded the necessary license to enter the premises where such excavation is to be made.

If there is no established curb grade, the depth of excavation

shall be referred to the level of the ground at the point under consideration. If an existing building or structure, the footings or foundations of which are required to be underpinned or protected, is so located that the curb grade or level to which it is properly referred is at a higher level than the level to which the excavation is properly referred, then such part of the required underpinning or protection that is necessary due to the difference in these levels shall be made and maintained at the joint expense of the owner of the building or structure and the person causing the excavation to be made. For the purpose of determining such part of the underpinning, or protection that is necessary due to such difference in levels, the level to which a building more than five feet back of the street line is properly referred shall be considered to be the level of the natural ground surface adjoining the building or structure.

A party wall which is in good condition and otherwise suitable for continued use, shall be underpinned or protected as required at the expense of the person causing the excavation to be made.

Where the necessary license has been given to the person making an excavation to enter any adjoining structure for the purpose of underpinning or protecting it, the person receiving such license shall provide for such adjoining structure adequate protection against injury due to the elements resulting from such entry.

Only approved granular materials shall be used for backfill. It shall be properly compacted in order to prevent lateral displacements of the soil of the adjoining property after the removal of the shores or braces.

SECTION 1302—FOOTINGS AND FOUNDATIONS

1302.1 — GENERAL

Except in the case of temporary structures or secondary buildings not over 1 story in height and not exceeding 400 square feet in area, footings and foundations, unless specifically provided, shall be constructed of grillages of steel, of masonry or of reinforced concrete (one and two family dwellings may not be required to have reinforced concrete footings or grillage of steel) in no case less than 12 inches below grade. Masonry units used in foundation walls and footings shall be laid up in Class A or B mortar. The base areas of all footings and foundations shall be proportioned as specified in Section 1302.3.

1302.2 — BEARING CAPACITY OF SOIL

Footings shall be so designed that the allowable bearing capacity of the soil in pounds per square foot as given below shall not be exceeded unless the particular soil on which the building is to be placed shows a greater bearing capacity than that specified in this Section, under tests as provided herein.

BEARING CAPACITIES OF VARIOUS SOILS

Foundation-bed	Pounds per sq. ft.
Soft clay -----	2,000
Firm Clay -----	3,000
Wet sand -----	4,000
Sand and clay, mixed or in layers -----	4,000
Fine and dry sand -----	4,000
Coarse sand -----	4,000

Where the bearing capacity of the soil is not definitely known or is in question, the Building Official may require load tests or other adequate proof as to the permissible safe bearing capacity at that particular location. To determine the safe bearing capacity of soil, it shall be tested at such locations and levels as conditions warrant, by loading an area not less than 4 square feet to not less than twice the maximum bearing capacity desired for use. Such double load shall be sustained by the soil for a period of not less than 48 hours with no additional settlement taking place, in order that such desired bearing capacity may be used. Examination of sub-soil conditions shall be made at the expense of the owner, when deemed necessary by the Building Official.

Foundations shall be built upon natural solid ground. Where solid natural ground does not occur at the foundation depth, such foundations shall be extended down to natural solid ground or piles shall be used.

Where footings are supported by soils of widely different bearing capacity, the allowable bearing values of the more yielding soil shall be reduced or special provisions shall be made in the design to prevent serious differential settlements.

When it is definitely known the top or sub-soils are of a shifting or moving character, all footings shall be carried to a sufficient depth to insure stability. The excavation around piers shall be back filled with soils or materials which are not subject to such expansion or contraction.

1302.3 — FOOTING DESIGN

The base area of the footings of all buildings shall be designed in the following manner: The area of the footing which has the largest percentage of live load to total load shall be determined by dividing the total load by the allowable soil load. From the area thus obtained the dead load soil pressure of such footing is determined and the areas of all other footings of the building shall be determined on the basis of their respective dead loads only and such dead load soil pressure. In no case shall the load per square foot under any portion of any footing, due to the combined dead, live, wind and/or any other loads, exceed the safe sustaining power of the soil upon which the footing rests. The total reduced live load occurring in the column immediately above the footing shall be the live load used in the above computation.

Footings shall be proportioned to sustain the applied loads and induced reactions without exceeding the allowable stresses specified

in this code.

Concrete in footings shall have an ultimate compressive strength of not less than 2,000 pounds per square inch at 28 days.

1302.4 — DOWELS

Dowels of the same number as the vertical bars in the column, but not less than four, shall extend into the column a distance of not less than 24 diameters for dowels of intermediate grade steel, and 30 diameters for dowels of hard grade steel, except that for plain bars (not deformed bars) the minimum amount of lap shall be 25 per cent greater. Dowels shall extend down into the supporting pedestal or footing the distance required to transfer the full working value of the dowel to the concrete without exceeding the bond stress permitted in Section 1603.4.

The thickness of concrete above the reinforcement shall be not less than 8 inches for footings bearing on soil, nor less than 12 inches for footings on piles. The thickness of concrete protecting the steel reinforcement shall in no case be less than 3 inches.

Design of footings shall be in accordance with Section 1601.1.

1302.5 — FOUNDATION WALLS

(a) Foundation walls shall be not less in thickness than the walls immediately above them and not less than 12 inches for unit masonry walls, or 8 inches for cast-in-place concrete walls; except that solid masonry walls extending not more than 5 feet, and hollow walls of masonry or walls of hollow units extending not more than 4 feet below the adjacent finished ground level may be 8 inches in thickness. These depths may be increased to a maximum of 7 feet with the approval of the Building Official when he is satisfied that soil conditions warrant such an increase. The total height of 8 inch foundation wall and wall supported shall not exceed that permitted by this code for 8 inch walls. In all cases, however, foundation walls shall have sufficient strength and thickness to resist all lateral pressures and to support all vertical loads without exceeding the unit stresses permitted by this code.

(b) Foundation walls of 8 inch thickness (except as provided for in section 1302.5. (c) and conforming to the provisions of Section 1302.5 (a) may be used as foundations for dwellings with walls of brick veneer on frame walls or with 10 inch cavity walls, provided that the dwelling is not more than 1-½ stories in height and the total height of the wall, including the gable, is not more than 20 feet. Foundation walls of 8 inch thickness supporting brick veneer or cavity walls, shall be corbeled with solid units to provide a bearing the full thickness of the wall above. The total projection shall not exceed 2 inches with individual corbels projecting not more than 1/3 the height of the unit. The top corbel course shall not be higher than the bottom of floor joists and shall be a full header course.

(c) Foundation walls of cast-in-place concrete when supporting one story basementless structures may be 6 inches thick if the total

height of the foundation wall and the wall supported is within the allowable height permitted by this code for 6 inch walls.

(d) Foundation wall vents shall be provided as set forth in Chapter XVII, Wood.

SECTION 1303—PILES

1303.1 — GENERAL REQUIREMENTS

(a) **Spacing**—The minimum center-to-center spacing of piles not driven to rock, shall be not less than twice the greatest diameter of a round pile, nor less than twice the diagonal dimension of a rectangular or rolled structural steel pile, nor less than 2 ft.-6 in.

The minimum center-to-center spacing of piles driven to rock shall be not less than the greatest diameter of a round pile plus one foot, nor less than the diagonal dimension of a rectangular or rolled structural steel pile plus one foot.

A column or pier supported by piles unless connected to permanent construction which provides adequate lateral support, shall rest on not less than three piles.

In no case shall the spacing of piles be such that the average load on the supporting stratum exceed the safe bearing value of that stratum.

(b) **Allowable loads**—All piles used to support any building or part thereof shall be driven to reasonably solid bearing in such a manner as not to impair their strength.

Subject to the limitations prescribed in this Section for the various types of piles, the safe load carrying capacity of piles shall be determined by means of load tests as provided in Section 1303.6 or the allowable load on piles may be determined in accordance with an approved formula, such as the following formula which are applicable where piles are not driven to rock and where piles are driven by a hammer in which the value of the energy per blow (in foot-pounds) delivered by the hammer shall be not less than three (3) times the weight of the pile in pounds.

For drop hammers:

$$R = \frac{2WH}{s + 1}$$

For single-acting steam hammers:

$$2WH$$

$$R = \frac{s + 0.1}{2WH}$$

For double-acting steam hammers:

$$2E$$

$$R = \frac{s + 0.1}{2E}$$

In which:

R = Allowable pile load in pounds

W = Weight of striking part of hammer in pounds

H = effective height of fall in feet

E = Actual energy delivered by the hammer per blow in foot pounds.

s = Penetration of pile per blow, inches, determined under conditions required by accepted good practice.

Piles shall be designed as short columns except that where piles extend above permanent ground or where piles below ground level receive negligible lateral support from the surrounding soil, they shall be designed as long columns throughout their unsupported length.

(c) Protection of piles—If, in the opinion of the Building Official, conditions may exist at a site where piles are to be used which will subject them to deterioration not adequately provided against by other provision of these requirements, he may require investigations to be made of such conditions. He may then require suitable protective measures to be employed or reductions in design loads or stresses to be made which will adequately provide against the special conditions disclosed by the investigations.

1303.2 — STEEL PILES

(a) Definition—Steel piles may consist of rolled shapes, pipe, or built-up structural shapes.

(b) Splices—Splices in steel piles shall be so made and installed as to resist driving shock and insure good alignment of the spliced parts. For each splice in excess of one, a 5% reduction in allowable load shall be made, unless splices are so made as to develop not less than one-third of the full bending strength of the steel section. Splices in piles whose length exceeds forty times the nominal size of the section shall develop at least one-third the full bending strength of the steel section. Piles which have been spliced at the mill, by an approved procedure, to develop full section strength shall be acceptable as the equivalent of unspliced piles.

(c) Concrete-filled steel pipe piles

Size—Concrete-filled steel pipe piles shall have a minimum nominal outside diameter of 10 $\frac{3}{4}$ inches and a nominal wall thickness of not less than 5/16 of an inch, except that piles having a nominal outside diameter of 14 inches or over, shall have a nominal wall thickness of not less than $\frac{3}{8}$ of an inch.

Nothing in this section shall be construed as prohibiting the use of concrete-filled steel pipe piles of less wall thickness or size than covered by the provisions of this paragraph (c), when such piles are driven with ends closed, provided the requirements of Sec. 1303.5 are satisfied.

Concrete—The concrete used in concrete-filled steel pipe piles shall have an ultimate strength at the end of 28 days of not less than 2,500 pounds per square inch.

Maximum loads on concrete-filled steel pipe piles—The allowable load on concrete-filled steel pipe piles shall be as specified in Section 1303.1 (b) but in no case shall the allowable load exceed 7500 pounds per square inch on the steel plus 20 per cent of the ultimate 28 day compressive strength of the concrete, provided that where the length of the pile exceeds 40 times the nominal outside diameter, the load on the concrete shall not exceed 16 per cent of its 28 day compressive strength. Furthermore, except where the safe load-carrying capacity is determined in accordance with the provisions of Section 1303.6, Tests of Piles, the allowable load per pile shall not exceed the values specified below:

1. Piles driven open-ended to rock:

10- $\frac{3}{4}$ "	Outside Diameter	Pile	55 tons
12- $\frac{3}{4}$ "	"	"	70 tons
14"	"	"	80 tons
16"	"	"	100 tons
18"	"	"	120 tons
20"	"	"	140 tons
22"	"	"	150 tons

The above loads are based on walls thicknesses of $\frac{3}{8}$ inch. They shall be reduced by ten per cent when wall thicknesses of $\frac{5}{16}$ inch are used. For each increase of $\frac{1}{16}$ inch in wall thickness, the above values may be increased by 10 per cent, with a maximum increase of 20 per cent.

2. Piles driven open-ended to cemented hardpan which is not underlaid by a softer stratum: Not more than the values given above for rock-bearing piles but in no case more than 70 tons.

3. Piles, driven open—or closed-ended, and bearing in gravel, sand, and similar granular material which is not underlaid by a softer stratum: load shall be not more than 50 tons.

4. Piles, driven open-or closed-ended, and bearing in other materials: 30 tons if driven 40 ft. or less into the ground; 40 tons if driven more than 40 ft. into the ground.

1303.2 (d) — ROLLED STRUCTURAL STEEL PILES

Size and Shape—Rolled structural steel piles shall be of H-form, with flange projection not exceeding 14 times the minimum thickness of metal in either flange or web, and with total flange width at least 85 per cent of the depth of the section. No section shall have a nominal thickness of metal less than $\frac{3}{8}$ inch nor a nominal depth in the direction of the web of less than 8 inches. Rolled structural steel piles 40 feet or less in length shall be unspliced sections, unless special permission be secured from the Building Official for the use of spliced sections, where unforeseen field conditions arise.

Maximum loads on rolled structural steel piles—The allowable load on rolled structural steel piles shall be as specified in Section 1303.1(b) but in no case shall the allowable load exceed 8500 pounds per square inch. Furthermore, except where the safe load-carrying

capacity is determined in accordance with the provisions of Section 1303.6, Tests of Piles, the allowable load per pile shall not exceed the values specified below:

1. Piles driven to practical refusal to a firm bearing on rock or on cemented hardpan not underlaid by a softer stratum.

Size of Pile (Nominal Depth in Inches)		Allowable Load
8	-----	40 tons
10	-----	45 tons
12	-----	55 tons *
14	-----	70 tons *

*Exception: For steel piles which are driven to practical refusal on bed rock, the maximum allowable load per pile shall be 70 tons for piles of 12" nominal depth and 90 tons for piles of 14" and over nominal depth, provided the unit load does not exceed 6800 pounds per square inch in any pile.

2. Piles bearing in gravel, sand, and similar granular material which is not underlaid by a softer stratum: not more than the values given above for rock-bearing piles, but in no case more than 50 tons.

3. Piles bearing in other materials: not over 30 tons if driven 40 feet or less into the ground; nor more than 40 tons if driven more than 40 feet into the ground.

1303.3 — CONCRETE PILES

Concrete piles shall be of material complying with the requirements for Portland cement, fine aggregate, coarse aggregate and reinforcement as specified in Chapter XVI, and steel as specified in Chapter XV. The maximum allowable working stress on any concrete pile shall not exceed 20 per cent of the ultimate 28 day compressive strength of the concrete used in the piles, determined by tests as specified in Chapter XVI.

The maximum allowable load on concrete piles shall be as specified in Section 1303.1(b), provided that in no case shall the pile load exceed the working unit stresses specified herein, multiplied by the average cross sectional area of the pile, and provided that except where the load capacity is determined by tests in accordance with Section 1303.6, the allowable load shall not exceed the following values:

For precast concrete piles, the maximum load in tons shall not exceed twice the average pile side dimension in inches, but not over 40 tons.

For cast-in-place concrete piles, the maximum load shall be 30 tons except that when the point diameter of such piles exceeds 15 inches an additional allowance of 2 tons may be allowed for each inch of increased diameter up to the maximum total load of 40 tons.

Concrete piles cast in place shall be made in such a manner as to insure the exclusion of any foreign matter and to secure a full sized

shaft. The diameter of piles cast in place shall be not less than 8 inches at the point and shall have an average diameter of not less than 11 inches.

No precast concrete pile shall be driven before the concrete has attained a compressive strength of at least 3,000 pounds per square inch, but in all cases concrete shall be sufficiently cured to attain the ultimate strength upon which its use is based, before piles are driven. Such piles shall be reinforced to withstand conditions of handling, driving, and loading, and shall be so handled and driven as not to cause injury or overstressing which will affect their durability or strength. Precast concrete piles shall have a diameter of not less than 10 inches.

Pile reinforcement shall have a protective cover of not less than 1½ inches of concrete except that where a pile has a metal casing, reinforcement shall be kept not less than 1 inch clear of such exterior casing.

1303.4 — WOOD PILES

Wood piles shall be in one piece and shall be of southern pine, red oak, Douglas fir, Norway pine, or other approved wood, containing no evidences of decay. The piles shall be free from short kinks or reverse bends and shall have a uniform taper from butt to tip. A straight line drawn from the center of the butt to the tip shall lie wholly within the body of the pile. The diameter of wood piles at the point shall be not less than 6 inches and at the butt shall be not less than 10 inches for piles 25 feet or less in length, and not less than 12 inches at the butt for piles more than 25 feet in length. No piles with spiral grain which exceeds one complete turn in 40 feet, shall be used. All wood piles and capping shall be cut off and/or placed below mean low water level or below lowest ground water level, with the exception of piles creosoted in accordance with the requirements of this section.

Piles of southern pine, Norway pine, Douglas fir, or red oak, when pressure treated, by an empty-cell process, with Grade One coal tar creosote to a net final retention of not less than 12 pounds of creosote per cubic foot of wood, may be used as follows: (1) Where the upper portion of the pile is exposed and accessible for inspection, the cut-off may be above ground level or water level; (2) Where the upper part of the pile will not be readily accessible for inspection, the cut-off shall be below the ground level but may be above the ground-water level provided the tops are encased in masonry footings so that no part of the pile will be exposed to the air. The cut-offs of creosoted piles shall be treated with three coats of hot creosote.

The use of other species of wood, consistent with the recommendations of the Forest Products Laboratory, for piles to extend above permanent ground-water level, and the use of other equivalent preservative materials and methods of treatment, which have been established by tests as sound engineering practice, shall be subject to the written permission of the Building Official.

The tops of all timber piles shall be sawed off clean along a horizontal plane.

No creosoted piling shall be used which has been so injured in handling or driving as to penetrate the creosoted shell, except in the case of bolt holes and unavoidable framing including the top cut-off, all of which shall be treated with three coats of hot creosote.

The allowable load on wood piles shall be in conformity with the requirements of Section 1303.1(b) provided that no wood piles shall be loaded in excess of 500 pounds per square inch of the right section of the pile at mid-length and provided that except where the load capacity is determined by tests in accordance with Section 1303.6, the maximum allowable load on a wood pile shall not exceed 15 tons.

1303.5 — SPECIAL TYPES OF PILES

The use of types of piles not specifically mentioned herein, and the use of piles under conditions not specifically covered herein, may be permitted, subject to the approval of the Building Official, upon the submission of acceptable test data, calculations and other information relating to the structural properties and/or load-carrying capacity of such piles. Prior to giving such approval, the Building Official may require any information or demonstrations which he deems necessary for the determination of the adequacy of the design or of the suitability of the method of installation. In no case, however, shall the allowable load exceed the limitations specified in the various subsections of Section 1303.

1303.6 — TESTS OF PILES

Safe load-carrying capacities may be determined by means of loading tests performed on not less than two typical piles of an installation. The allowable load shall in no case exceed one-half of that load which causes a net settlement, after deducting rebound, of more than $1/200$ of an inch per ton of test load or more than one-half inch, nor shall it exceed one-half of that load under which, during a 48 hour period of continuous constant load application, no appreciable additional settlement takes place.

Where any doubt exists as to the safe load-carrying capacity of any pile, the Building Official may order a loading test to be made on the pile. Subject to the limitations prescribed in the various subsections of Section 1303, the allowable pile load shall be determined as prescribed in the foregoing paragraph.

SECTION 1304—CAISSONS

The footings of any structure may be carried down to a firm foundation by isolated piers of reinforced concrete or by open or pneumatic caissons either with or without enlarged base or bell at the bottom. The safe carrying capacity of such shafts or caissons shall not exceed the allowable unit bearing capacity of the soil multiplied by the area of the base or bell at bottom, provided such bell shall have at least 12 inch thickness of concrete at its edge and the sides shall slope at an angle of not less than 60 degrees with the horizontal unless of approved design properly reinforced. In no case shall such piers be of less than 2 feet minimum horizontal dimension.

CHAPTER XIV

MASONRY AND VENEERED WALLS

SECTION 1401—GENERAL

All masonry construction shall conform to the provisions of this Chapter and in all cases shall be of sufficient thickness to keep the stresses in the masonry within the working stresses prescribed.

Tests of masonry materials may be required at reasonable intervals to determine whether they conform to these requirements. Such tests shall be made in accordance with the standards prescribed for each material.

Masonry units may be re-used when clean, whole and conforming to the other requirements of this Chapter.

The minimum wall thicknesses and other minimum or maximum dimensions are given as nominal dimensions. The actual masonry dimensions may vary from the nominal dimensions by not more than one half ($\frac{1}{2}$) inch.

SECTION 1402—MATERIALS

1402.1 — BRICK

Brick of clay, shale, sand-lime, or concrete shall be of a quality at least equal to that required by A. S. T. M. Specifications C62-49 for clay or shale brick, C73-39 for sand-lime brick, or C55-37 for concrete brick. When in contact with ground or exposed to the weather, the brick shall be of at least Grade MW for clay, shale or sand-lime brick; or Grade A for concrete brick.

1402.2 — OTHER SOLID CLAY OR SHALE UNITS

Other solid masonry units of clay or shale shall meet the requirements for physical properties of clay or shale brick as specified in Section 1402.1.

1402.3 — CONCRETE MASONRY UNITS

Concrete masonry units shall be of a quality at least equal to that required by A.S.T.M. "Specifications for Hollow Load-Bearing Concrete Masonry Units (C90-44) or "Specifications for Solid Load-Bearing Concrete Masonry Units" (C145-40) when used for bearing walls or piers, or when in contact with ground or exposed to the weather; or equal to "Specifications for Hollow Non-Load-Bearing Concrete Masonry Units" (C129-39) when used for non-bearing purposes and not exposed to the weather.

1402.4 — STRUCTURAL CLAY TILE

Structural clay tile shall be of a quality at least equal to that required by A.S.T.M. "Specifications for Structural Clay Load-Bear-

ing Wall Tile" C34-49 Grade LB when used for bearing walls or piers, or Grade LBX when exposed to the weather or soil; or equal to "Specifications for Structural Clay Non-Load-Bearing Tile" C56-49 when used for interior non-load-bearing purposes; or equal to "Specifications for Structural Clay Floor Tile" (C57-39) when used for floor construction.

1402.5 — CAST STONE

Cast stone shall be of a quality at least equal to that required by "Specifications for Cast Stone" (704-44) of the American Concrete Institute.

1402.6 — PLAIN CONCRETE

Cast-in-place concrete construction reinforced only for shrinkage or temperature changes shall be classed as plain concrete. Plain concrete, other than fill, shall conform to the requirements for reinforced concrete and have a minimum ultimate compressive strength at 28 days of 2,000 lbs. per Sq. In.

1402.7 — STONE

Natural stone shall be sound and free from loose or friable inclusions, with sufficient strength, durability, and resistance to impact for the proposed use.

1402.8 — ARCHITECTURAL TERRA COTTA

Architectural terra cotta shall have a strong homogeneous body and give a sharp, metallic, bell-like ring when struck. All units shall have the necessary anchor holes and shall be so formed as to properly engage with the supporting structure.

1402.9 — GLAZED BUILDING UNITS

Glazed building units shall be of a quality at least equal to that required by A.S.T.M. "Specifications for Glazed Building Units" (C126-44) except that the requirements for finish shall not apply to salt-glazed building units.

1402.10 — GYPSUM UNITS

Gypsum partition tile or block shall be of a quality at least equal to that required by A.S.T.M. "Specifications for Gypsum Partition Tile or Block" (C52-41.)

Gypsum partition tile or block shall not be used in bearing walls or in exterior walls.

1402.11 — STRUCTURAL GLASS BLOCK

Structural glass block shall comply with the provisions of Section 1410.

1402.12 — CEMENTITIOUS MATERIALS

Cementitious materials used in mortars shall be of a quality at least equal to the quality of materials required by the following applicable specifications.

"Quicklime for Structural Purposes," A.S.T.M. C5-26.

"Hydrated Lime for Structural Purposes," A.S.T.M. C6-49

"Hydraulic Hydrated Lime for Structural Purposes," A.S.T.M. C141-42.

"Natural Cement," A.S.T.M. C10-37.

"Masonry Cement," Federal Specifications SS-C-181b.

"Portland Cement," A.S.T.M. C150-49

"Gypsum," A.S.T.M. C22-41.

"Special Finishing Hydrated Lime," A.S.T.M. C206-49.

1402.13 — AGGREGATE

Aggregate for mortar shall be of a quality at least equal to that required by A.S.T.M. "Specifications for Aggregate for Masonry Mortar" (C144-44).

1402.14 — WATER

Water used in mixing mortar shall be clean, and free from deleterious amounts of acids, alkalies, oils or organic materials.

1402.15 — MORTAR PROPORTIONS AND WORKABILITY

Mortar as delivered to the mason shall have a flow after suction for one minute of not less than 65 per cent of that immediately before suction when determined by the method of the Water Retention Test of the Federal Specification for Masonry Cement, SS-C-181b.

The volume of aggregate in mortar shall be at least two times but not more than three times the volume of cementitious material.

1402.16 — TYPE OF MORTAR

Mortar used in masonry construction shall be classified as follows:

Type	Minimum compressive strength of 2-in. cubes at 28 days, Lb. per Sq. In.
A	2,500
B	600
C	200
D	75

Unless the strength classification of the mortar has been established by test in accordance with this section, mortars using the following cementitious materials may be assumed to meet the strength classification shown when mixed with aggregate in the proportions required by Section 1402.15.

Type A—1 part portland cement and not more than $\frac{1}{4}$ part of hydrated lime or lime putty.

Type B—1 part portland cement and not more than $1\frac{1}{4}$ parts hydrated lime or lime putty; or masonry cement, Type II.

Type C—1 part portland cement and not more than $2\frac{1}{2}$ parts hydrated lime or lime putty; or masonry cement, Type I.

Type D—1 part hydrated lime or lime putty and not more than $\frac{1}{2}$ part portland cement.

When it is desired to establish the strength Classification of a mortar by test, the strength shall be determined with mortar prepared in a testing laboratory of representative materials and in the proportion proposed for use. The test cubes shall be molded, cured and tested for compressive strength as described in the Federal "Specifications for Masonry Cement" (SS-C-18lb.), except that for Type D mortar the entire curing shall be in laboratory air at 70 degrees F. plus or minus 5 degrees.

1402.17 — TYPES OF MORTAR REQUIRED

Masonry shall be laid in Type A, Type B, or Type C mortar, except as follows:

Type A or B mortar shall be used in nominal 10-inch cavity walls, foundation walls of hollow masonry units, and masonry linings of existing masonry walls.

Type A or Type B mortar shall be used in footings, foundation walls of solid masonry units, isolated piers, load-bearing or exterior walls of hollow masonry units, hollow walls of masonry, parapet walls, and cavity walls exceeding 10-inch nominal thickness.

Type D mortar may be used in solid masonry walls, other than parapet walls or rubble stone walls, not in contact with the soil and not less than 12 inches thick nor more than 35 feet in height, provided the walls are laterally supported at intervals not exceeding 12 times the wall thickness.

Gypsum partition tile and block shall be laid in gypsum mortar, composed of 1 part gypsum to not more than 3 parts sand by weight. Non-bearing partitions and fireproofing of structural clay tile may be laid in gypsum mortar. Fire brick shall be laid in fire clay or air-setting mortar.

SECTION 1403—WORKING STRESSES

Unless otherwise determined, the maximum allowable compressive stresses in masonry shall not exceed those given in Table No. 1403.

Table No. 1403 — WORKING STRESSES IN MASONRY

Unit	Working stress, Lb. per Sq. In., gross areas			
	Type of mortar			
	A	B	C	D
Brick and				
Solid Units of Clay or Shale;				
Sand-lime or concrete brick				
4,500 Lb. per Sq. In. *	250	200	150	100
2,500 Lb. per Sq. In. *	175	140	110	75
1,500 Lb. per Sq. In. *	125	100	75	50

Table No. 1403 (Continued)

Concrete Units (Solid)

Grade A	175	125	80
Grade B	125	100	60
Hollow	85	70	-----
Structural Clay Tile	85	70	-----
Rubble Stone	140	100	80
Stone Ashlar	400	320	250
Cast Stone	400	320	250
Cavity Walls			160
Solid Units	125	100	-----
Hollow Units	60	50	-----

Plain Concrete—25 percent of the ultimate strength **

* Average compressive strength of units tested in the position taken in the masonry.

** When the ratio of height to thickness of structural members of plain concrete exceeds 10, this percentage shall be reduced proportionately to 18 percent for a ratio of height to thickness of 20.

In walls or other structural members composed of different kinds of grades of units or mortar, the maximum stress shall not exceed the allowable stress for the weakest of the units and mortar of which the member is composed.

SECTION 1404—MINIMUM WALL THICKNESS

1404.1 — BEARING WALLS — GENERAL

Unless otherwise required for fire-resistance or for strength, the minimum thickness of solid masonry bearing walls shall be 12 inches for the uppermost 35 feet of their height and shall be increased 4 inches in thickness for each successive 25 feet or fraction thereof measured downward from the top of the wall; except as follows:

A one (1) story building, or top story of a building not over three stories in height of Groups A, B, C, D or E Occupancy, may be eight (8) inches in thickness, provided the roof beams are horizontal and such story height does not exceed fourteen (14) feet to point of lateral support; except that walls of residential buildings not exceeding two and one-half (2½) stories or thirty (30) feet in height may be eight (8) inches thick.

Walls of one-story single-family dwellings and private garages may be 6 inches thick when not greater in height than 9 feet, with an allowance of an additional 6 feet for gables.

In Group F Storage, Group G Industrial, and Group H Special Occupancies, the minimum thickness of solid masonry bearing walls shall be 12 inches for the uppermost 25 feet of their height and shall be increased 4 inches in thickness for each successive 25 feet or fraction thereof measuring downward from the top of the wall if the building is of construction other than Type I, Fireproof Construction or Type II, Fire-Resistive Construction.

The minimum thickness of walls of structural clay tile or hollow concrete masonry units shall be as specified for solid masonry walls except that they shall not exceed 50 feet in height above their support.

1404.2 — CAVITY WALLS

Cavity walls and hollow walls of solid masonry units shall not exceed 35 feet in height except that 10 inch cavity walls shall not exceed 25 feet in height. In cavity walls neither the facing nor the backing shall be less than 4 inches in thickness and the cavity shall be not less than 2 inches nor more than 3 inches in width.

1404.3 — CONCRETE WALLS

Plain concrete walls may be 2 inches less in thickness than required by Section 1404.1, but not less than 8 inches except where 6 inch walls are specifically permitted.

1404.4 — RUBBLE STONE WALLS

Rubble stone walls shall be 4 inches thicker than required for solid masonry walls of the same height but in no case less than 16 inches.

1404.5 — NON-BEARING WALLS

Except as required for fire-resistance, non-bearing exterior walls of masonry may be 4 inches less in thickness than required for bearing walls but shall be not less than 8 inches thick except as otherwise specifically permitted in chapter X, Fire-Resistive Ratings.

1404.6 — ROOF STRUCTURES

Except as required for fire-resistance or for strength, masonry walls above roof level enclosing stairways, elevator shafts, penthouses or bulkheads may be 8 inches thick when 12 feet or less in height, and shall not be considered as increasing the height or requiring any increase in the thickness of the wall below.

SECTION 1405—LATERAL SUPPORT

Masonry walls or bearing partitions shall be supported at right angles, (horizontal or vertical), to the wall face at intervals not exceeding 20 times the wall thickness for solid masonry if laid in Type A, B or C mortar; 12 times the wall thickness for solid masonry if laid in Type D mortar; 18 times the wall thickness for hollow masonry units and hollow walls of masonry; and 14 times the wall thickness for cavity walls.

Lateral support shall be measured either horizontally or vertically whichever is lesser, by cross walls, piers, pilasters, floors or roofs.

The width of pilasters shall not be less than one-tenth (1/10) the space between such pilasters. All pilasters shall be not less than four (4) inches thicker than the wall supported.

SECTION 1406—NON-BEARING PARTITIONS

All non-bearing interior partitions of masonry shall be built solidly against floor and ceiling construction below and above, and shall not exceed the unsupported heights given in Table 1406.

Table No. 1406 — MINIMUM THICKNESSES OF NON-BEARING PARTITIONS

Thickness exclusive of plaster, inches		Maximum unsupported height, feet
2	(Not over 6 Ft. in length)	9
3		12
4		15
6		20
8		25

SECTION 1407—PARAPET WALLS

Parapet walls shall be not less than 8 inches thick, nor shall the height be more than four times the thickness unless properly reinforced. They shall be properly coped with incombustible, weather-proof material.

There shall be placed in all parapet walls, scuppers or relief openings as close as practical to each downspout of not less than 4 to 6 inches in size and spaced not more than 6 inches above the roofline unless the roof is especially designed for water cooling, in which case the scuppers may be raised to provide for retaining the water.

SECTION 1408—BOND

1408.1 — BRICK

There shall be a header course in all brick walls at least every seventh course on both sides of the wall or there shall be at least 1 full length header in every $1\frac{1}{2}$ square feet of wall surface and the distance between adjacent full length headers shall not exceed 20 inches either vertically or horizontally.

1408.2 — HOLLOW OR SOLID UNITS

When 2 or more hollow units or solid units exceeding brick size are used to make up the thickness of a wall, the inner and outer courses shall be bonded at vertical intervals not exceeding 34 inches by lapping at least 4 inches or by lapping with units at least 50 percent greater in width than the units below at vertical intervals not exceeding 17 inches. Hollow masonry units shall have full mortar coverage of the face shells in both the horizontal and vertical joints.

1408.3 — FACING

Brick facing shall be bonded to walls of solid or hollow masonry units as required by Section 1408.1.

Ashlar facing of either natural or cast stone shall have at least 20 percent of the superficial area extending not less than 4 inches into the backing to form bond stones, which shall be uniformly distributed

throughout the wall. Every projecting stone, except when alternate courses are full bond courses, and every stone not a bond stone, shall be securely anchored to the backing with substantial non-corrodible metal anchors with a cross section of not less than 0.2 Sq. In. There shall be at least 1 anchor to each stone and not less than 2 anchors for each stone more than 2 feet in length and 3 square feet in superficial area. Facing stones not over 12 square feet in area shall have at least 1 anchor to each 4 square feet of superficial face area. Where bonded to the backing as prescribed herein, facing may be counted as part of the required wall thickness.

1408.4 — CAVITY WALLS

Cavity walls shall have a 3/16 inch non-corrodible metal rod or metal tie of equivalent stiffness placed in the horizontal joints, for each 3 square feet of wall surface. Additional bonding ties shall be placed around the perimeter of all openings and shall be spaced not more than 3 feet apart and within 1 foot of the opening.

SECTION 1409—MISCELLANEOUS DETAILS

1409.1 — CHANGE IN THICKNESS

Except for permissible chases and recesses, walls shall not vary in thickness between their lateral supports. When a change in thickness due to minimum thickness requirements occurs between floor levels the greater thickness shall be carried to the higher floor level. Where cavity walls, hollow walls, or walls of hollow masonry units are decreased in thickness a course of solid masonry shall be interposed between the wall section below such point and that next above.

1409.2 — CHASES

Chases in masonry walls shall not be deeper than one-third the wall thickness nor longer than 4 feet horizontally and shall have at least 8 inches of masonry in back of the chases and between chases and jambs of openings, provided that in dwellings not over two stories high, chases not over 4 inches deep, 30 inches wide and 24 inches high, may be built in 8 inch walls and provided that chases below windows may equal the width of the opening above. The back and sides of such chases in exterior walls shall be water-proofed and insulated.

1409.3 — SUPPORTED MEMBERS

When combustible structural members frame into walls of thickness not greater than 12 inches, they shall project not more than 4 inches into the wall and shall be so spaced that the distance between embedded ends is not less than 4 inches. The space above, below and between such members shall be filled solidly with burnt-clay materials, mortar, concrete, or equivalent fire-resistive material to a depth of not less than 4 inches on all sides of the members.

Beams, joists, girders or other concentrated loads supported by a wall or pier shall have bearing at least 4 inches in length upon solid masonry or upon a metal bearing plate of adequate design and dimensions to distribute safely the loads on the wall or pier.

1409.4 — SUPPORT

No masonry shall be supported on combustible construction.

1409.5 — CORBELING

Corbeling of walls for chimneys shall be in accordance with Section 802.1 (b) ,Chimney Construction.

1409.6 — ANCHORAGE

Masonry walls that meet or intersect shall be adequately bonded or anchored. Masonry walls shall be securely anchored to each tier of wood joists or wood beams bearing on them, by approved metal anchors at maximum intervals of 6 feet in one and two-family dwellings and 4 feet in other buildings. The ends of all wood beams or joists entering masonry walls shall be cut to a bevel of at least 3 inches in the depth. Masonry walls parallel to wood joists or wood beams shall be provided with approved metal anchors at maximum intervals of 8 feet in one- and two-family dwellings, and 6 feet in other buildings, engaging three joists or beams. Cast-in-place concrete slabs bearing on masonry walls shall be considered as sufficient anchorage for the supporting walls.

1409.7 — PIERS

The unsupported height of masonry piers shall not exceed 10 times their least dimension. When structural clay tile or hollow concrete masonry units are used for isolated piers to support beams and girders, the cellular spaces shall be filled solidly with concrete or Type A mortar, except that unfilled hollow piers may be used if their unsupported height is not more than 4 times their least dimension.

1409.8 — OPENINGS

The masonry above openings shall be supported by well buttressed arches or lintels of metal or masonry, plain or reinforced, which shall bear on the wall at each end for not less than 4 inches.

1409.9 — FREEZING

All masonry shall be protected against freezing for at least 24 hours after laying. No masonry shall be built upon frozen material.

1409.10 — WETTING

Brick of clay or shale laid in other than Type D mortar shall be wetted when laid unless their gain in weight is less than $\frac{3}{4}$ ounce when immersed flatwise in $\frac{1}{8}$ inch of water for one minute.

1409.11 — ERECTION

Except when carried independently by girders at each floor, no wall shall be built up more than 25 feet in height in advance of other walls of the building. Walls shall be adequately braced during erection.

SECTION 1410—STRUCTURAL GLASS BLOCK

1410.1 — USE

Glass blocks may be used in exterior or interior walls in openings which might otherwise be filled with windows, either isolated or in continuous bands, provided the glass block panels have a minimum overall thickness at the mortar joint of at least $3\frac{1}{2}$ inches and provided further that all mortar surfaces shall have satisfactory treatment for mortar bonding properties. Glass blocks shall not be used in any fire or party wall, elevator shaft or other vertical opening.

1410.2 — CONSTRUCTION

Glass block panels, vertical or horizontal, for exterior walls shall not exceed in area 144 square feet of unsupported wall surface nor shall they exceed 20 feet in one direction between supports. Continuous panels may be used, but the above panel size shall not be exceeded between vertical or horizontal supports. There shall be a spandrel wall or beam not less than 2 feet high above the finished floor line at all adjoining floors.

For interior walls no single panel nor portion of a continuous series of panels of glass block construction in partitions shall exceed 250 square feet of unsupported area, nor shall exceed 25 feet in either horizontal or vertical dimension between structural supports.

1410.3 — ACCESS PANELS

Each story, above the first story or ground floor, may have readily identified access panels for Fire Department use in every frontage and spaced not more than 50 feet apart horizontally. Each panel may consist of a metal sash with flat glass at least 32 inches wide and 48 inches high, fixed or openable.

1410.4 — MORTAR

Glass blocks shall be laid up in Type B mortar. All mortar joints shall be completely filled and pointed after the mortar has passed its initial set and shall have a thickness of at least $\frac{1}{4}$ inch and not more than $\frac{3}{8}$ inch.

1410.5 — TIES

Horizontal mortar joints shall be reinforced with ties which shall run continuously from end to end of mortar joint, but must not "bridge" expansion joints. Where splices occur the individual lengths shall be lapped not less than 6 inches.

Ties shall be formed of two parallel steel wires No. 16 gauge or larger, spaced 2 inches apart by steel cross wires No. 16 gauge or larger, welded thereto at intervals not exceeding 8 inches, and galvanized after forming, or equivalent reinforcement. They shall be located in horizontal joints as follows:

Blocks $5\frac{3}{4}$ In. high in wall every fourth course.

Blocks $7\frac{3}{4}$ In. high in wall every third course.

Blocks $11\frac{3}{4}$ In. high in wall every course.

1410.6 — SUPPORTS

Glass block panels must be adequately supported to resist wind pressure and protected from forces caused by expansion or contraction by properly designed expansion joints which shall be entirely free of mortar. The back of all chases shall be filled with an approved resilient material, the side of each joint lined with tightly packed oakum or other similar material and pointed with non-hardening caulking material at least $\frac{1}{2}$ inch deep. The sill shall be coated with an approved asphalt emulsion previous to laying the first course of mortar.

1410.7 — GLASS BLOCK PANELS

Where glass blocks are to be used as a veneer in masonry construction, the glass block panels shall be self-supporting, with suitable ties into the masonry wall, and shall be clear from and not adhering to the masonry.

SECTION 1411—EXISTING WALLS

No existing wall shall be used for renewal or extension of a building, or increased in height without specific permission from the Building Official.

SECTION 1412—GROUTED MASONRY

1412.1 — GENERAL

Grouted masonry shall conform to all the requirements of Section 1401 to 1409, inclusive, except as modified by this Section.

1412.2 — MORTAR AND GROUT

Only Types A or B mortars shall be used. Grout shall be Types A or B mortars with the addition of sufficient water to give the required consistency.

1412.3 — BOND

In grouted masonry with all interior joints filled with grout, headers need not be used.

1412.4 — CONSTRUCTION

All units in the two outer tiers shall be laid with full bed and head joints. All interior joints shall be filled with grout. One face tier may be carried up three courses before grouting, but the other face tier shall be carried up not more than one course above the grouting. All longitudinal vertical joints shall be not less than $\frac{3}{4}$ inch in thickness. Horizontal construction joints shall be formed by stopping the grout $1\frac{1}{2}$ inches below the top of the face tiers.

SECTION 1413—REINFORCED SOLID MASONRY

1413.1 — GENERAL

Reinforced solid masonry shall conform to the requirements for grouted masonry except as modified by this section.

1413.2 — DESIGN

The design shall be based on the assumptions, limitations, and methods of stress determination specified for reinforced concrete in Chapter XVI. The design stresses shall not exceed those given in Chapter XII or in Table No. 1413.

1413.3 — MORTAR AND GROUT

Only Type A mortar and grout shall be used.

1413.4 — REINFORCEMENT

The width or thickness of any space containing reinforcement shall be at least $\frac{1}{2}$ inch greater than the size of any bar or than the sum of the sizes of bars which cross, except that $\frac{1}{4}$ inch bars may be used in $\frac{1}{2}$ inch bed joints.

In reinforced masonry walls, the minimum area of reinforcement in each direction shall be not less than 0.001 times the cross-sectional area of the wall except that when considered as ordinary or grouted masonry lesser amounts may be used to resist tensile stresses.

Vertical reinforcement which supports horizontal reinforcement shall be not less than $\frac{3}{8}$ inch in diameter.

If the wall is constructed of more than 2 tiers, the reinforcement shall be equally divided into 2 layers.

Table No. 1413 — ALLOWABLE STRESSES IN REINFORCED
SOLID MASONRY

Type of Stress	Allowable Unit Stresses Lb. per Sq. In.
Compression (Extreme fiber stress in bending)	500
Direct Compression on Piers	400
Shear (no web reinforcement)	30
Shear (with web reinforcement, taking entire shear)	60
Bond: Deformed bars, Vertical Bars	60
Horizontal bars	80
Modulus of Elasticity E	1,500,000
Modulus of Rigidity G (Modulus of Elasticity in shear)	600,000

SECTION 1414—REINFORCED GYPSUM CONCRETE

Gypsum shall conform to the requirements of the A.S.T.M. "Specifications for Gypsum" (C22-41).

Design, construction and testing of reinforced gypsum concrete shall conform to A.S.A. "Standard Building Requirements for Reinforced Gypsum Concrete" (A59) dated May 8, 1941. Reinforcement shall conform to the requirements Chapter XVI.

A competent inspector satisfactory to the Building Official shall be present on the work at all times when cast-in-place gypsum concrete is being mixed or deposited.

SECTION 1415—VENEERED WALLS

1415.1 — GENERAL

Veneer shall not be assumed as supporting any load other than its own weight.

1415.2 — MASONRY VENEER ON MASONRY WALLS

Except as provided elsewhere in this section masonry veneer applied to masonry backing shall be anchored to the backing either by a header for every 300 square inches of wall surface, extending 4 inches into the backing, or by approved corrosion-resistant metal wall ties spaced not farther apart than 16 inches vertically and 24 inches horizontally. The veneer shall not be counted as part of the required thickness of bearing walls and shall not exceed 35 feet in height above approved supports.

1415.3 — MASONRY VENEER ON WOOD OR STEEL FRAMING

Except as provided elsewhere in this section, masonry veneer applied to wood or steel framing shall be anchored to the structural framing members by approved non-ferrous metal ties or 40 d galvanized nails at intervals of not more than sixteen (16) inches vertically and twenty-four (24) inches horizontally.

Masonry veneer on framed walls shall be supported upon the foundations except that such veneer attached to steel framing may be supported upon other approved non-combustible supports.

Masonry veneer on steel framing shall not exceed three (3) stories nor thirty-five (35) feet in height above foundation or other approved non-combustible supports. Masonry veneer shall not be attached to wood framing at any point more than 20 feet above the foundation, except in gables.

1415.4 — METAL VENEERS

Metal veneers that are exposed to the weather shall be of corrosion-resistant metal, or of metal covered front and back with porcelain enamel or given other approved treatment or coating to render them corrosion-resistant.

Metal veneers shall be securely attached to the supporting masonry or framing members with corrosion-resistant metal ties or by other approved devices or methods. Such attachments and their supports shall be capable of resisting a horizontal force equal to the wind loads specified in this code, but in no case less than 20 Lbs. per square foot.

No metal attachment shall have a cross-sectional area less than provided by No. 9 B.W.G. gauge wire (.0173 Sq. In.). Attachments shall be spaced not more than 24 inches apart horizontally and not more than 16 inches apart vertically, but where units exceed four square feet in area, there shall be not less than four attachments per unit.

All metal or wood supports for metal veneers shall be protected against the effects of moisture; metal supports shall be protected by painting or equivalent protection; wood supports shall have been given approved preservative treatment.

All joints and edges in metal veneers that are exposed to the weather shall be caulked or pointed with approved durable waterproofing material or shall be protected by other approved means to prevent penetration of moisture.

No masonry back-up shall be required for metal veneers except as is necessary to meet the fire-resistance requirements of this code.

1415.5a—TERRA COTTA LESS THAN 1 INCH THICK

The backing for this type of veneer shall be a 1:2 cement mortar not less than 1 inch thick and shall be reinforced with 4 inch galvanized welded wire reinforcing securely fastened to masonry with approved corrosion-resistant anchors. The mortar shall be worked to a true plane surface, given a trowel finish and then surface scratched to receive a setting bed.

A setting bed not less than $\frac{3}{4}$ inch thick shall be applied and shall be cement mortar mixed in proportions of not less than 1 part cement to 2 parts sand, with waterproofing compound added. Sand shall be screened through a 20 mesh screen.

Tile or terra-cotta units shall be not larger than 144 square inches in area and shall be scored or keyed on the back surface.

In addition to the $\frac{3}{4}$ inch setting bed, veneer less than 1 inch thick shall be provided with mechanical anchorage of either the continuous angle or pin and rosette type, or other approved mechanical anchor device. In all cases, holes for attachment screws or bolts shall be accurately drilled using a drill slightly smaller in diameter than the attachment bolt or screw shields and shall be drilled to not less than 1 inch in depth. All parts of the mechanical anchorage device used shall be made of corrosion-resistant metal. At least one attachment screw or expansion bolt shall be provided for each square foot of veneering.

1415.5b—CERAMIC AND PORCELAIN

The tile units may have either a glazed or unglazed surface, but in all localities within the frost belt the units must be frostproof.

For veneering in excess of eight feet above the adjacent ground or street level, substructure materials to which the tile is to be fastened shall be either masonry or concrete. For concrete structures the surface shall be bush hammered.

A 16 gauge 2"x2" electrically welded wire mesh or equal anchorage shall be fastened to the substructure with non-corrosive anchors in such a manner as to become imbedded in the scratch coat.

A cement mortar scratch coat of one part cement, one-fifth part high calcium type lime putty, four parts sand and a proportion of ironizing compound as recommended by the manufacturer shall be applied not less than $\frac{3}{8}$ " nor more than 1" in thickness and

trowelled to a true and even plane. This coating shall be scratched or scored to provide a roughened surface.

A setting bed or float coat of cement mortar (the same as the scratch coat) approximately $\frac{3}{8}$ " thick shall be applied. The tile shall then be immediately set in place in the setting bed by first applying to the back of each tile a bond coat of neat cement and ironizing compound no less than 1/16" in thickness.

Immediately before applying the scratch coat and also setting bed a bond coat slurry of neat cement, to which has been added ironizing compound in proportion as recommended by the manufacturer, shall be sprayed, brushed or dashed upon the surface.

The joints in the finished tile surface shall be grouted or pointed with a waterproof Portland cement joint compound.

1415.6 — GLASS VENEER

(a) **Size and Thickness**—The maximum area of any single unit of glass veneer shall not exceed 10 Sq. Ft. when located not more than 15 feet above the sidewalk. When located more than 15 feet above the sidewalk, the maximum area of any unit shall not exceed 6 Sq. Ft. The maximum length of any glass unit shall not exceed 48 inches.

(b) **Backing Materials**—The backing shall be a substantial, rigid incombustible surface of true plane, plumb and straight. It may be of stone, concrete, brick, tile, cinder block, or cement mortar on metal lath. Cement mortar and lath may be attached to wood studs spaced not over 12 inches on centers provided wood studs have been given approved preservative treatment.

Wood backing surfaces shall not be used.

The application of glass veneer over other veneers is prohibited.

(c) **Setting of Glass Veneer** — The backing and glass veneer shall be thoroughly dry and an approved bond coat applied with uniform and complete coverage to effectively seal the surface of the backing. Glass veneer shall be set in place with an approved mastic cement, so that at least 60 percent of the total area of the glass is bonded to the backing. The bond coat and mastic cement shall be certified as of such composition as to insure close affinity between the two materials.

(d) **Sidewalk Line** — Where glass veneer extends to the sidewalk surface, each such section shall rest in an approved metal moulding set at least $\frac{1}{4}$ inch above the highest point of the sidewalk. The space under this moulding shall be thoroughly caulked and made watertight. In no case shall glass veneer extend below the level of the sidewalk.

(e) **Bulkhead** — Where the glass veneer between the sidewalk line and the sill of a show window is more than 16 inches high, the glass veneer shall contain at least one horizontal joint between the top and bottom edges.

(f) **Joints** — All abutting edges of glass veneer shall be ground square. Mitres are prohibited except for wide angles. All joints shall

be uniformly buttered with an approved pointing compound and shall be held to a thickness of not less than 1/16 inch by an approved non-rigid substance or device. Where glass veneer is confined between non-resilient materials at ends, expansion shall be provided for by means of an expansion joint at each end of not less than 1/4 inch throughout the entire height of the veneer.

(g) **Shelf Angles** — On all glass veneer starting on a line with the top of the bulkhead facing or at a maximum of 36 inches above the sidewalk line, the mastic cement binding shall be supplemented by the use of approved corrosion-resistant metal shelf angles secured to the backing. These angles shall be located in the horizontal joints in every course.

(h) **Mechanical Fastening** — Where glass veneer is applied at an elevation higher than 8 feet above the sidewalk level, the mastic cement shall be supplemented by the use of approved corrosion-resistant metal fastenings on each vertical or horizontal edge of each glass unit. Such fastenings shall be not less than 2 inches in length and shall be of thickness not less than No. 18 U. S. gauge. Fastenings shall be so designed as to furnish bearing support and also hold the veneer in a vertical plane independently of the mastic cement.

All such fastenings shall be secured through the backing directly into the wall beyond by means of approved anchors of toggle bolts in a manner satisfactory to the Building Official. Where a continuous fastening member is used, it must be secured to the backing at least every 30 inches.

(i) **Flashing** — Upon the completion of glass veneer installation, exposed edges shall be flashed with corrosion-resistant sheet metal and caulked with a waterproof compound and their application shall be approved by the Building Official.

SECTION 1416—MARBLE VENEER

1416.1 — CLASS "A" MARBLE

Class "A" Marble shall be hard, sound marble and free of any unsound lines. It shall be of uniform thickness and size.

1416.2 — SIZES AND THICKNESSES

Minimum thicknesses shall be seven-eighths inch (7/8") and maximum sizes of pieces fifteen square feet (15 Sq. Ft.), with lengths not exceeding five feet (5'). Where total continuous height of marble above sidewalk is over thirty-five feet (35'), lower supporting portion shall be increased to one and one-fourth inches (1 1/4") in thickness.

1416.3 — MATERIALS

Only Class "A" sound marbles shall be used in such work without reinforcing. Other classes of marble may be used but only if lined with marble or slate strips three inches by seven-eighths inches

(3"x7/8") fastened to back of marble across the lines of unsoundness, or if solidly backed with seven-eighth inch (7/8") marble or slate slabs. Backing or strips in such cases shall be attached in the manufacturers shop before shipment by means of use of approved stone cement.

1416.4 — BACKING

Backing of main front of building shall be either brick or tile, and shall be back from finished marble face two inches (2") for Class "A" and three inches (3") for unsound lined marbles.

1416.5 — BASE AND JAMBS

Marble veneers under and over glass show windows inside of vestibules may be fastened to wood studding, if the studding is properly cross braced, and spaced on not more than twelve inch (12") centers. Wood head jambs shall be hung on metal rods of sufficient strength, which shall be bolted to floor slab above. Studding shall be kept back two inches (2") and three inches (3") from finished marble face, same as required for brick or tile (Section 1416.4).

1416.6 — FASTENINGS AND PLASTER

Plaster of paris or quick setting molding plaster shall be used for anchor spots on back of marble and face of brick or tile wall. Anchors shall be of non-ferrous metal and not less than No. 8 B&S gauge wire. Holes in backing shall be large enough to hold supply of plaster with excelsior in which the looped end of anchor wire is set. All anchor wire used in edges of marble for proper ties shall be securely wedged into holes by means of lead plugs or by other approved methods. Each piece of marble having eighteen inches (18") as its least dimension shall have four supporting anchors. All other pieces less than eighteen inches (18") wide shall have three anchors.

Marble slabs as they are erected shall have edges buttered with waterproof cement, forced against adjoining pieces to leave only proper joint between marble edges. Joints between marble slabs shall not be less than one-sixteenth (1/16") or greater than one-eighth inch (1/8").

1416.7 — IRON WORK

Iron work behind marble or in connection with marble shall be painted with rust resisting paint before start of marble setting.

CHAPTER XV—STEEL

STRUCTURAL STEEL

(Riveted, Bolted or Welded Construction)

SECTION 1501—GENERAL

1501.1 — SCOPE

The requirements of Sections 1501 to 1510 of this chapter shall govern the design, fabrication, and erection of structural steel for buildings and other structures except that the requirements do not apply to steel joists, members formed of flat-rolled sheet or strip, light-gage steel construction, skylights, marquees (except structural frame), fire escapes, or other miscellaneous light steel construction. (See Section 1511).

1501.2 — GENERAL

Except as otherwise specifically provided in this code or in rules duly promulgated by the Building Official, the Specifications for the Design, Fabrication and Erection of Structural Steel for Buildings June 1949 Edition of the American Institute of Steel Construction shall be accepted as good practice in structural steel construction.

1501.3 — WELDING

Details of welding technique, inspection of welding, and qualifications of welding operators shall conform to the recommendations of the Code for Arc and Gas Welding in Building Construction (Jan. 1946) of the American Welding Society.

SECTION 1502—MATERIALS

1502.1 — STRUCTURAL STEEL

Structural steel shall conform to the Standard Specifications of the American Society for Testing Materials for Structural Steel for Bridges and Buildings, Serial Designation A7-49-T

1502.2 — RIVET STEEL

Rivet steel shall conform to the Standard Specifications of the American Society for Testing Materials for Structural Rivet Steel, Serial Designation A141-49-T.

1502.3 — FILLER METAL

All arc-welding electrodes shall conform to the requirements of the American Welding Society Specifications for Iron and Steel Arc-Welding Electrodes, (1946 edition). Electrodes shall be of classification Numbers E6010, E6011, E6012, E6013, E6020 or E6030 and shall be suitable for the positions and other conditions of intended use.

With each container of electrodes the manufacturer shall furnish instructions giving recommended voltage and amperage (and polarity if direct current) for all uses and welding positions for which the electrode is suitable.

1502.4 — STOCK MATERIAL

(a) Stock material shall be of a quality equal to that required by Section 1502.1. Mill test reports shall constitute sufficient record as to the quality of material carried in stock.

(b) Unidentified stock material, if free from surface imperfections, may be used for short sections of minor importance, or for small unimportant details, where the precise physical properties of the material would not affect the safety of the structure.

SECTION 1503—ALLOWABLE UNIT STRESSES

1503.1 — GENERAL

Except as provided herein under "Bending," all parts of the structure shall be so proportioned that the unit stress in pounds per square inch shall not exceed the following values:

1503.2 — STRUCTURAL STEEL, RIVETS, BOLTS AND WELD METAL

(1) TENSION

Structural Steel, net section	20,000
Butt welds, section through throat	20,000
Rivets, on area based on nominal diameter	20,000
Bolts and other threaded parts, on nominal area at root of thread	20,000

(2) COMPRESSION

Columns, gross section

For axially loaded columns with values of l/r	
not greater than 120	$17,000 - 0.485 \frac{l^2}{r^2}$
For axially loaded columns with values of l/r	
greater than 120	18,000

$$1 + \frac{l^2}{18,000 r^2}$$

in which l is the unbraced length of the column, and r is the corresponding radius of gyration of the section, both in inches.

Plate Girder Stiffeners, gross section	20,000
Webs of Rolled Sections at toe of fillet (crippling)	24,000
Butt-Welds, section through throat (crushing)	20,000

(3) BENDING

Tension on extreme fibers of rolled sections, plate girders, and built-up members,

(See Section 1508.1)	20,000
----------------------	--------

Compression on extreme fibers of rolled sections, plate girders, and built-up members,	
With ld not in excess of 600	20,000
bt	
With ld in excess of 600	12,000,000
bt	ld
	bt

in which l is the unsupported length and d the depth, of the member; b is the width, and t the thickness, of its compression flange; all in inches; except that l shall be taken as twice the length of the compression flange of a cantilever beam not fully stayed as its outer end against translation or rotation.

Exception:

Fully continuous beams and girders may be proportioned for negative moments which are maximum at interior points of support, at a unit bending stress 20 percent higher than above stated; provided that the section modulus used over supports shall not be less than that required for the maximum positive moments in the same beam or girder, and provided that the compression flange shall be regarded as unsupported from the support to the point of contra-flexure.

Stress on extreme fibers of pins 30,000

Fiber stresses in butt welds, due to bending, shall

not exceed the values prescribed for tension in compression, respectively.

For columns proportioned for combined axial and bending stresses, the maximum unit bending stress F_b , Sect. 1503.4 may be taken at 24,000 pounds per square inch, when this stress is induced by the gravity (vertical) loading of fully or partially restrained beams framing into the columns.

(4) SHEARING

Rivets	15,000
Pins, and turned bolts in reamed or drilled holes	15,000
Unfinished bolts	10,000
Webs of beams and plate girders, gross section	13,000

Weld Metal

on section through throat of fillet weld, or on faying surface area of plug or slot weld	13,600
on section through throat of butt weld	13,000

(Stress in a fillet weld shall be considered as shear on the throat, for any direction of applied

stress. Neither plug nor slot welds shall be assigned any values in resistance to stresses other than shear.)

(5) BEARING

	Double Shear	Single Shear
Rivets	40,000	32,000
Turned bolts in reamed or drilled holes	40,000	32,000
Unfinished bolts	25,000	20,000
Pins	32,000	
Contact Area		
Milled Stiffeners and Other Milled Surfaces	30,000	
Fitted Stiffeners	27,000	
Expansion rollers and rockers (pounds per linear inch)	600d	
in which d is diameter of roller or rocker in inches.		

1503.3 — CAST STEEL

Compression and Bearing, same unit stresses as specified for Structural Steel. Other Unit Stresses, 75 percent of those specified for Structural Steel.

1503.4 — COMBINED AXIAL AND BENDING STRESSES

Members subject to both axial and bending stresses shall be so proportioned that the quantity

$$\frac{fa + fb}{Fa + Fb} \text{ shall not exceed unity, in which}$$

Fa = axial unit stress that would be permitted by this Specification if axial stress only existed.

Fb = bending unit stress that would be permitted by this Specification if bending stress only existed.

fa = axial unit stress (actual) = axial stress divided by area of member.

fb = bending unit stress (actual) = bending moment divided by section modulus of member.

1503.5 — WIND ONLY

Members subject only to stresses produced by wind forces may be proportioned for unit stresses 33 1-3 percent greater than those specified for dead and live load stresses. A corresponding increase may be applied to the allowable unit stresses in their connecting rivets, bolts or welds.

1503.6 — WIND AND OTHER FORCES

Members subject to stresses produced by a combination of wind and other loads may be proportioned for unit stresses 33 1-3 percent greater than those specified for dead and live load stresses, provided the section thus required is not less than that required for the combination of dead load, live load, and impact (if any). A corresponding increase may be applied to the allowable unit stresses in their connecting rivets, bolts or welds.

SECTION 1504—SLENDERNESS RATIO

(a) The ratio of unbraced length to least radius of gyration, l/r , for compression members and for tension members other than rods shall not exceed:

For main compression members 120

For bracing and other secondary members in compression 200

For main tension members 240

For bracing and other secondary members in tension 300

(b) The slenderness of a main compression member may exceed 120, but not 200; provided that it is not ordinarily subject to shock or vibratory loads and provided that its unit stress under full design loading shall not exceed the following fraction of that stipulated under Section 1503.2 (2), for its actual ratio l/r :

$$\left(\frac{1.6 - l}{200r} \right)$$

SECTION 1505—MINIMUM THICKNESS OF MATERIAL

1505.1—GENERAL

The following stipulations (1) and (2) as to minimum thickness shall apply to exterior steelwork enclosed in a non-impervious envelope or exposed to frequent rain or snow, and to interior steelwork subject to atmospheric exposure more corrosive than indoor atmosphere controlled for human comfort.

(1) Columns, studs, lintels, girders and beams; exterior trusses, exterior bracing members; one-fourth inch minimum.

(2) Purlins, girts, trusses and bracing members sheltered from direct exposure to rain and snow; three-sixteenths inch minimum.

The controlling thickness of rolled shapes, for the purposes of stipulations (1) and (2), shall be taken as the mean thickness of their flanges, regardless of web thickness.

Steelwork exposed to industrial fumes or vapor shall be given special protection as required in the judgment of the Engineer.

SECTION 1506—CONNECTIONS

1506.1—CONNECTIONS OF TENSION AND COMPRESSION MEMBERS IN TRUSSES

The connections at ends of tension or compression members in trusses shall develop the strength required by the total stresses; but in no case shall such strength developed be less than 50 percent of the effective strength of the material connected.

1506.2 — MILLED JOINTS IN COMPRESSION MEMBERS

Where compression members are in full-milled bearing on base plates, and where full-milled tier-building columns are spliced, there shall be sufficient rivets, bolts or welds to hold all parts securely in place.

Where other compression members are spliced by full-milled bearing, the splice material and its riveting or welding shall be arranged to hold all parts in line and shall be proportioned for 50 percent of the computed stress.

All the foregoing joints shall be proportioned to resist any tension that would be developed by specified wind forces acting in conjunction with 75 percent of the calculated dead load stress and no live load, if this condition will produce more tension than with full dead load and live load applied.

1506.3 — RIVETS AND BOLTS IN COMBINATION WITH WELDS

In new work, rivets or bolts in combination with welds shall not be considered as sharing the stress, and welds shall be provided to carry the entire stress for which the connection is designed.

In making welded alterations to structures, existing rivets may be utilized for carrying stresses resulting from existing dead loads, and the welding need be adequate only to carry all additional stress.

1506.4 — TURNED BOLTS

Turned bolts in close-fitting holes as specified in Section 1509.3 may be used in shop or field work where it is impracticable to drive satisfactory rivets. The finished shank shall be long enough to provide full bearing, and washers shall be used under the nuts to give full grip when the nuts are turned tight.

The term "turned bolt" embraces all bolts regardless of the manufacturing process, which have a tolerance on the nominal diameter of 0 over, .006 inch under, and which have regular semi-finished heads conforming to American Standard B18-2 of the American Institute of Bolt, Nut and Rivet Manufacturers.

SECTION 1507—COMPOSITE BEAMS

1507.1 — DEFINITION

The term "composite beam" shall apply to any rolled or fabricated steel floor beam entirely encased in a poured concrete haunch at least four inches wider, at its narrowest point, than the flange of the beam, supporting a concrete slab on each side without openings adjacent to the beam; provided that the top of the beam is at least 1½ inches below the top of the slab and at least 2 inches above the bottom of the slab; provided that a good grade of stone or gravel concrete with Portland cement, is used; and provided that the concrete haunch has adequate mesh, or other reinforcing steel, throughout its whole depth and across its soffit.

1507.2 — DESIGN ASSUMPTIONS

Composite beams may be figured on the assumption that:

1. The steel beam carries, unassisted, all dead loads prior to the hardening of the concrete, with due regard for any temporary support provided, and
2. The steel and concrete carry by joint action all loads, dead and live, applied after the hardening of the concrete.

1507.3 — UNIT STRESSES

The total tensile unit stress in the extreme fiber of the steel beam thus computed shall not exceed 20,000 pounds per square inch. (Section 1503.2 (1).

The maximum stresses in the concrete and the ratio of Young's moduli, for steel and concrete, shall be as prescribed by the specifications governing the design of reinforced concrete for the structure.

1507.4 — END SHEAR

The web and the end connections of the steel beam shall be designed to carry the total dead and live load, except as this may be reduced by the provision of other proper support.

SECTION 1508—PLATE GIRDERS AND ROLLED BEAMS

1508.1 — PROPORTIONING

Riveted and welded plate girders, cover-plated beams, and rolled beams shall in general be proportioned by the moment of inertia of the gross section. No deduction shall be made for standard shop or field-rivet holes in either flange; except that in special cases where the reduction of the area of either flange by such rivet holes exceeds 15 percent of the gross flange area, the excess shall be deducted. If such members contain other holes, as for bolts, pins, countersunk rivets, or plug or slot welds, the full deduction for such holes shall be made. The deductions thus applicable to either flange shall be made also for the opposite flange if the corresponding holes are there present.

1508.2 — WEB

Plate girder webs shall have a thickness of not less than $1/170$ of the unsupported distance between flanges.

SECTION 1509—WORKMANSHIP

1509.1 — GENERAL

All workmanship shall be equal to the best practice in modern structural shops.

1509.2 — GAS CUTTING

The use of a cutting torch is permissible if the metal being cut is not carrying substantial stress during the operation. To determine the effective width of members so cut, 1/8 inch shall be deducted from each gas-cut edge.

1509.3 — RIVETED CONSTRUCTION—HOLES

Holes for rivets or unfinished bolts shall be 1/16 inch larger than the nominal diameter of the rivet or bolt. If the thickness of the material is not greater than the nominal diameter of the rivet or bolt plus 1/8 inch, the holes may be punched. If the thickness of the material is greater than the nominal diameter of the rivet or bolt plus 1/8 inch, the holes shall be either drilled from the solid, or sub-punched and reamed. The die for all sub-punched holes, and the drill for all sub-drilled holes, shall be at least 1/16 inch smaller than the nominal diameter of the rivet or bolt.

Drifting to enlarge unfair holes shall not be permitted. Holes that must be enlarged to admit the rivets shall be reamed. Poor matching of holes shall be cause for rejection.

Holes for turned bolts shall be not more than 1/50 inch larger than the external diameter of the bolts. All drilling or reaming for turned bolts shall be done after the parts to be connected are assembled; except that if such drilling or reaming after assembly is impracticable, it may be done through steel templets with hardened bushings.

1509.4 — RIVETING

Rivets shall be driven by power riveters, of either compression or manually-operated type, employing pneumatic or electric power. After driving they shall be tight and their heads shall be in full contact with the surface.

Rivets shall ordinarily be hot-driven, in which case their finished heads shall be of approximately hemispherical shape and shall be of uniform size throughout the work for the same size rivet, full, neatly finished and concentric with the holes. Hot-driven rivets shall be heated uniformly to a temperature not exceeding 1950° F.; they shall not be driven after their temperature has fallen below 1000° F.

Rivets may be driven cold if approved measures are taken to prevent distortion of the riveted material. The requirements for hot-driven rivets shall apply except as modified in the Tentative Specifications for Cold-Driven Rivets of the American Institute of Bolt, Nut and Rivet Manufacturers.

1509.5 — WELDED CONSTRUCTION—PREPARATION OF MATERIAL

Surfaces to be welded shall be free from loose scale, slag, rust, grease, paint and any other foreign material, except that mill scale which withstands vigorous wire brushing, may remain. A light film

of linseed oil may be disregarded. Joint surfaces shall be free from fins and tears. Preparation of edges by gas cutting shall, wherever practicable, be done with a mechanically guided torch.

1509.6 — WELDED CONSTRUCTION—ASSEMBLING

Parts to be fillet welded shall be brought in as close contact as practicable, and in no event shall be separated more than 3/16 inch. If the separation is 1/16 inch or greater, the size of the fillet welds shall be increased by the amount of the separation. The separation between faying surfaces of lap joints shall not exceed 1/16 inch. The fit of joints at contact surfaces which are not completely sealed by welds, shall be close enough to exclude water after painting.

1509.7 — WELDED CONSTRUCTION—TEMPERATURES

No welding shall be done when the temperature of the base metal is lower than 0° F. At temperatures between 32° F., and 0° F., the surface of all areas within three inches of the point where a weld is to be started, shall be heated to a temperature at least warm to the hand before welding is started.

When welds are being made in parts thicker than 1½ inches, the temperature of the base material adjacent to the welding shall be at least 70° F.

1509.8 — WELDING

The technique of welding employed, the appearance and quality of welds made, and the methods used in correcting defective work shall conform to the American Welding Society Code for Arc and Gas Welding in Building Construction, Section 4-Workmanship.

All complete-penetration butt welds, except when produced with the aid of backing material or welded in the flat position from both sides in square-edge material not more than 5/16 inch thick with root opening not less than one-half the thickness of the thinner part joined, shall have the root of the initial layer gouged or chipped out on the back side before welding is started from that side, and shall be so welded as to secure sound metal and complete fusion throughout the entire intended cross section. Butt welds made with the use of a backing of the same material as the base metal shall have the weld metal thoroughly fused with the backing material. Backing strips may be removed by means of gas cutting, after welding is completed, provided no injury is done to the base and weld metal and the weld surface is left flush or slightly convex with full throat thickness.

1509.9 — FINISHING

Compression joints depending upon contact bearing shall have the bearing surfaces machined to a common plane after the members are completed.

1509.10 — TOLERANCES

Finished members shall be true to line and free from twists, bends and open joints.

Compression members may have a lateral variation not greater than 1/1000 of the axial length between points which are to be laterally supported.

A variation of 1/32 inch is permissible in the overall length of members with both ends milled.

Members without milled ends which are to be framed to other steel parts of the structure may have a variation from the detailed length not greater than 1/16 inch for members 30 feet or less in length, and not greater than 1/8 inch for members over 30 feet in length.

SECTION 1510—ERECTION

1510.1 — BRACING

The frame of steel skeleton buildings shall be carried up true and plumb, and temporary bracing shall be introduced wherever necessary to take care of all loads to which the structure may be subjected, including equipment, and the operation of same. Such bracing shall be left in place as long as may be required for safety.

1510.2 — FIELD CONNECTIONS

All field connections may be made with unfinished bolts, except as follows:

Rivets or welds shall be used for the following connections; except that turned bolts may be used in lieu of rivets as provided in Section 1506.4.

Column splices in all tier structures 200 feet or more in height.

Column splices in tier structures 100 to 200 in height, if the least horizontal dimension is less than 40 percent of the height.

Column splices in tier structures less than 100 feet in height, if the least horizontal dimension is less than 25 percent of the height.

Connections of all beams and girders to columns, and of any other beams and girders on which the bracing of columns is dependent, in structures over 125 feet in height.

Roof-truss splices and connections of trusses to columns, column splices, column bracing, knee braces and crane supports, in all structures carrying cranes of over 5-ton capacity.

Connections for supports of running machinery, or of other live loads which produce impact or reversal.

Any other connections stipulated in the design plans.

For the purpose of this Section, the height of a tier structure shall be taken as the vertical distance from the curb level to the highest point of the roof beams, in the case of flat roofs, or to the mean height of the gable, in the case of roofs having a rise of more

than 1 in 4½. Where the curb level has not been established, or where the structure does not adjoin a street, the mean level of the adjoining land shall be used instead of curb level. Penthouses may be excluded in computing the height of structure.

SECTION 1511—LIGHT STEEL CONSTRUCTION

1511.1 — SCOPE—GENERAL

Light steel construction, as defined for the purpose of this Code, is that type of construction built in total or in part with steel structural members, and/or panels formed of steel less than ¼ inch thick and/or as excepted in Section 1501.1. Such members and panels may be formed hot, or formed cold from strip or sheet steel and may be used alone or in combination with other light steel structural members or with other materials when designed in accordance with good engineering practice and when alone or in combination are capable of supporting all required loads without exceeding the allowable unit stresses specified in this Section.

1511.2— DESIGN AND MATERIALS

(a) The "Specifications for the Design of Light Gauge Steel Structural Members" of the American Iron and Steel Institute may be accepted as good engineering practice.

(b) **Stresses and Material**—The unit design stress of steel of all grades shall in no case exceed the yield strength of the steel divided by 1.85. For steel conforming to Grade C ASTM Tentative Specifications for Light Gauge Structural Quality Flat Rolled Carbon Steel (ASTM, A245-48-T or ASTM, A246-48-T) the maximum working stresses shall not exceed 18,000 lbs. per sq. in.

(c) **Thickness**—Steel of qualities as specified above, used to form light steel construction members shall be of thickness not less than specified below:

CELLULAR CONSTRUCTION

Steel floors, panel walls and roof construction	18 U. S. Gauge
Compression members	20 U. S. Gauge
Tension members	20 U. S. Gauge
STEEL JOISTS	18 U. S. Gauge
BEARING STUDS	18 U. S. Gauge
STEEL BEAMS	16 U. S. Gauge
RIBBED STEEL ROOF CONSTRUCTION	22 U. S. Gauge

Steel joists are those members that directly support floor and/or roof slabs.

Protection—All structural panels or members formed of light gauge steel shall have one shop coat of paint or equivalent protection.

Tests—At the discretion of the Building Official, tests may be required to prove that the construction meets the requirements of this Code, or certified reports of such tests conducted by an approved and recognized testing laboratory will be accepted.

1511.3—STEEL JOIST CONSTRUCTION

(a) **Scope**—Steel Construction as governed by the requirements of this Section shall be that type of construction in which decks or top slabs are supported by separate steel members herein designated as "Steel Joists," spaced not further apart than 24" on centers in floors and 30" on centers in roofs, but in no case spaced further apart than the safe span of the top slab, deck or floor. Such steel joists may be made of hot or cold formed sections, strip, or sheet steel, riveted or welded together, or by expanding.

Note—Where steel joists are used at wider spacings than specified in the paragraph above, the construction shall not be considered Steel Joist Construction, but shall be designed and constructed in accordance with recognized engineering practice.

In manufacturing, storage or similar buildings subject to heavy concentrated or moving loads, use of steel joists, for floors shall be limited to live loads not exceeding 125 Lbs. per sq. ft., and adequate top slab and lateral support shall be provided to support and distribute such loads.

(b) **Material**—Steel shall conform to the requirements of the Standard Specifications for Steel for Bridges and Buildings. (ASTM 245-48-T except that joists formed of strip or sheet steel shall conform to Grade C of ASTM Tentative Specifications for Light Gauge Structural Quality, Flat Rolled, Carbon Steel (ASTM A246-48-T or A7-49-T A-246-44-T).

(c) **Design and Maximum Stress**—Open web steel joists shall be designed as a truss, solid web steel joists as a beam. Deck or top slabs over steel joists shall not be assumed to carry any part of the compression stress in the steel joists.

For steel meeting the requirements of Section 1511.3.(b) the maximum design stress shall not exceed 18,000 lbs. per. Sq. In.

Compression chords and diagonals of open web steel joists shall not have a ratio of length (clear distance between welds or attachments) to least radius of gyration in excess of 120, nor shall the unit compression stress exceed 15,000 Lbs. per Sq. In.

Steel joists or parts of joists formed of strip or sheet steel shall be designed in accordance with recognized engineering practice provided the unit design stress shall in no case exceed the yield strength of the steel divided by 1.85. The "Specifications for the Design of Light Gauge Steel Structural Members" of American Iron and Steel Institute may be accepted as recognized engineering practice.

(d) **Protective Coating**—All steel joists shall receive one coat of asphalt base paint or equivalent applied by dipping or spraying or an equivalent protective covering, before leaving the shop.

(e) **Manufacture**—All joints of the members that comprise a steel joist shall be made by connecting the members directly to one another by fusion or resistance welds, or by rivets.

In the case of expanded joists, a portion of the metal may be left intact to form a connection.

In the case of nailer joists, using wood nailer strips, such wood nailer strips shall be firmly attached to the top chord of the joist. Such nailer strips shall be of good grade wood at least $1\frac{1}{2}$ " x $1\frac{1}{2}$ " in net section.

(f) **Anchorage**—The ends of steel joists shall extend a distance of at least four inches on masonry or reinforced concrete supports, and at least two and one-half inches on steel supports except that where opposite joists butt over a steel support and positive approved means of attachment to the steel support is furnished which will prevent displacement of the member, a shorter bearing length may be used to provide the necessary bearing area. Every third steel joist on concrete or masonry supports shall be anchored thereto with an anchor, equivalent to a $\frac{3}{8}$ -inch round bar. The ends of all steel joists supported on masonry walls shall be bedded in mortar.

All steel joists supported on steel beams shall be secured thereto with an anchor made of not less than a $\frac{3}{16}$ -inch round bar fastened over the flanges of supporting beams, or other equivalent approved attachment, except that in the case of buildings having a height of more than twice the least dimension of the base, each steel joist shall be welded, bolted or riveted to the supporting steel work.

(g) **Span**—The span of the joists shall not exceed 24 times the depth of the steel portion of the steel joist.

(h) **Bridging**—(1) As soon as steel joists have been erected and before application of construction loads, bridging shall be installed between them. This bridging shall be adequate to safely support the top cords or flanges against lateral movement during the construction period and shall hold the steel joists in an approximately vertical plane passing through the bearing. The steel joists at the ends of panels shall be braced laterally by anchors or ties at each line of bridging.

When slab reinforcing is of a pre-stressed type; in addition to the bridging, a reinforcing bar shall be welded to the top cord of steel bar joists. Bars shall be continuous and there shall be one (1) bar adjacent to each line of bridging. All bars shall have six (6) inch 90° bends at the ends and shall be turned down in the wall to form an anchor to take care of lateral stress.

(2) The number of lines of bridging shall be: one row, near the center, for spans up to 14 feet; two rows, one quarter span apart, for spans 14 to 21 feet; and three rows for spans 21 to 32 feet.

- (3) In the case of steel joists carrying a wood deck or equivalent, the deck may be used as the top member of the bridging system when the deck is securely nailed to the joists.

(i) **Ceiling Protection**—Where fire-resistive construction is required, steel joists shall be protected on the underside with a fire-resistive ceiling and shall have a reinforced concrete or gypsum top slab, all as is necessary for the assembly to provide the required degree of fire resistance as set forth in Table 1007., provided that where wood joists construction is permitted, steel joists may have wood nailing strip attached to the top chord or top flange, and provided further that where steel joists are used in places where unprotected wood joists are permitted, no ceiling protection need be provided.

(j) **Decks or Top Slabs**—Decks or top slabs over steel joists may be of concrete or gypsum poured on metal lath centering or other equally suitable permanent centering, or on removable centering, provided the top chords or flanges of the steel joists are stayed laterally by the top slab.

Precast concrete top slabs, precast gypsum top slabs, wood decks, or steel decks may be used over steel joists provided they are securely anchored to the top chords or flanges of the joists.

(k) **Accepted Practice**—In the absence of specific requirements, as provided in this Section, steel joist construction shall be governed by accepted engineering practice as defined in the Standard Specifications for Steel Joists of the Steel Joist Institute.

1511.4 — STEEL ROOF DECK CONSTRUCTION

(a) **Scope**—This Section shall govern the design of steel roof deck construction used on spans not over 10' 0" and shall govern when in conflict with other provisions of this Code. Its provisions shall apply to decks having longitudinal ribs spaced not over 6" on center and formed of metal not less than No. 22 U. S. Standard Gauge in thickness.

(b) **Uses**—Steel roof deck construction may be used on all structures. Where required to be of fire-resistive construction, it shall be protected on the underside with a ceiling, and protected above with insulation to provide the degree of fire resistance specified in Chapter X.

(c) **Design and Material**

(1) **Stresses and Material**—The maximum working stress shall in no case exceed the yield strength of the steel divided by 1.85. For steel conforming to Grade C-ASTM Tentative Specifications for Light Gauge Structural Quality, Flat Rolled, Carbon Steel (ASTM A-245-44-T or ASTM A-246-44-T) the working stress shall not exceed 18,000 Lbs. Per Sq. In.

(2) **Properties**—For the purpose of determining the struc-

tural properties of steel roof decks, the effective width of the top flange between ribs shall be limited to the following percentages:

Thickness of Deck Metal	Width of Top Flange Effective
No. 18 U. S. Standard Gauge	75%
No. 20 U. S. Standard Gauge	62%
No. 22 U. S. Standard Gauge	53%

(3) **Moment and Deflection Co-efficients**—Where steel roof deck units extend over three or more spans, a moment co-efficient of $1/10$ th and a deflection co-efficient of $3/384$ shall be used provided deck units are welded to the supports. All other steel deck installations shall be designed as simple spans.

(4) **Maximum Deflection**—The maximum deflection of steel roof deck under design live load shall not exceed $1/180$ of the clear span except that where plastered ceilings are attached directly to or supported by such deck, the maximum deflection shall not exceed $1/360$ of the clear span.

(5) **Anchorage**—Steel deck units shall be anchored to the supporting frame work to resist the following gross uplifts: 45 pounds per Sq. Ft. for eave overhang and monitor roofs. 30 pounds per Sq. Ft. for all other roof areas. The dead load of the roof deck construction may be deducted from the above forces.

(6) **Protection**—All steel roof decks shall have one shop coat of paint or equivalent protection.

1513.4—Tests—In lieu of designing according to Section 1511.4 (c), tests may be made to determine the structural properties of a deck, based on the maximum allowable unit stress and maximum deflection specified herein. Such tests shall be performed on bare metal deck on simple spans supported on knife edges, with concentrated loads applied at the quarter points of the span or uniform distributed loads pneumatically applied.

CHAPTER XVI

CONCRETE

MATERIALS, MIX AND DESIGN

SECTION 1601—GENERAL

1601.1 — SCOPE

(a) These regulations cover the use of reinforced concrete and plain concrete in any structure to be erected under the provisions of this Building Code.

(b) The design of all reinforced concrete structures, including all of their component parts, shall be in accordance with the requirements as set forth in Building Regulations for Reinforced Concrete, serial designation ACI 318-47*, as published by the American Concrete Institute.

1601.2 — PERMITS AND DRAWINGS

Drawings and typical details of all reinforced concrete construction showing the size and position of all structural members, metal reinforcement, design strength of concrete, and the live load used in the design shall be filed with the Building Department as a permanent record before a permit to construct such work will be issued. All plans submitted for approval or use on the work shall clearly show the strength of concrete at a specified age for which all parts of the structure were designed. Calculations pertaining to the design shall be filed with the drawings when required by the Building Official.

1601.3 — SPECIAL SYSTEMS OF REINFORCED CONCRETE

The sponsors of any special system of reinforced concrete that is in conflict with, or not covered by, provisions of this Chapter may apply to the Board of Adjustments and Appeals as set forth in Section 112—Appeals.

1601.4 — DEFINITIONS

The following terms are defined for use in this code:

Aggregate—Inert material which is mixed with portland cement and water to produce concrete.

Column—An upright compression member the length of which exceeds three times its least lateral dimension.

Column Capital—An enlargement of the upper end of a reinforced concrete column designed and built to act as a unit with the column and flat slab.

*May be secured from American Concrete Institute, 7460 Second Boulevard, Detroit, Michigan.

Column Strip—A portion of a flat slab panel one-half panel in width consisting of the two adjacent quarter-panels on either side of the column center lines and extending through the panel in the direction of the span considered for bending.

Combination Column—A column in which a structural steel section, designed to carry the principal part of the load, is wrapped with wire and encased in concrete of such quality that some additional load may be allowed.

Composite Column—A column in which a steel or cast-iron section is completely encased in concrete containing spiral and longitudinal reinforcement.

Concrete—A mixture of portland cement, fine aggregate, coarse aggregate and water.

Deformed Bar—Reinforcing bars with closely spaced shoulders, lugs or projections formed integrally with the bar during rolling. Wire mesh with welded intersections not farther apart than twelve inches in the direction of the principal reinforcement and with cross wires not smaller than No. 10 W & M gauge may be rated as a deformed bar.

Diagonal Band—A group of reinforcing bars covering a width approximately 0.4 the average span, placed symmetrically with respect to the diagonal running from corner to corner of the panel of a flat slab.

Direct Band—A group of reinforcing bars covering a width approximately 0.4 of 11 placed symmetrically with respect to the center lines of the supporting columns of a flat slab.

Drop Panel—The structural portion of a flat slab which is thickened in the area surrounding the column capital.

Effective Area of Concrete—The area of a section which lies between the centroid of the tensile reinforcement and the compression face of the flexural member.

Effective Area of Reinforcement—The area obtained by multiplying the right cross-sectional area of the reinforcement by the cosine of the angle between its direction and the direction for which the effectiveness is to be determined.

Flat Slab—A concrete slab reinforced in two or more directions, generally without beams or girders to transfer the loads to supporting columns.

Middle Strip—A portion of a flat slab panel one-half panel in width, symmetrical about the panel center line and extending through the panel in the direction of the span considered for bending.

Paneled Ceiling—A flat slab in which approximately that portion of the area enclosed within the intersection of the two middle strips is reduced in thickness.

Panel Length—The distance along a panel side from center to center of columns of a flat slab.

Pedestal—An upright compression member whose height does not exceed three times its least lateral dimension.

Plain Concrete—Concrete without reinforcement, or reinforced only for shrinkage or temperature changes.

Ratio of Reinforcement—The ratio of the effective area of the reinforcement to the effective area of the concrete at any section of a flexural member.

Reinforced Concrete—Concrete in which reinforcement other than that provided for shrinkage or temperature changes is embedded in such a manner that the two materials act together in resisting forces.

Surface Water—The water carried by the aggregate except that held by absorption within the aggregate particles themselves.

SECTION 1602—MATERIALS AND TESTS

1602.1 — TESTS

(a) The Building Official, or his authorized representative, shall have the right to order the test of any material entering into concrete or reinforced concrete when there is reasonable doubt as to its suitability for the purpose; to order reasonable tests of the concrete from time to time to determine whether the materials and methods in use are such as to produce concrete of the necessary quality; and to order the test under load of any portion of a completed structure, when the conditions have been such as to leave reasonable doubt as to the adequacy of the structure to serve the purpose for which it is intended.

(b) Tests of materials and of concrete shall be made in accordance with the requirements of the American Society for Testing Materials as noted elsewhere in this chapter. The complete records of such tests shall be available for inspection by the Building Official at all times during the progress of the work, and shall be preserved by the engineer or architect for two years after the completion of the structure.

1602.2 — LOAD TESTS

When a load test is required, the member or portion of the structure under consideration shall be subject to a superimposed load equal to one and one-half times the live load plus one-half of the dead load. This load shall be left in position for a period of twenty-four hours before removal. If, during the test, or upon removal of the load, the member or portion of the structure shows evident failure, such changes or modifications as are necessary to make the

structure adequate for the rated capacity shall be made; or, where lawful, a lower rating shall be established. The structure shall be considered to have passed the test if the maximum deflection at the end of the twenty-four hour period does not exceed the value of D as given in the following:

$$D = \frac{.001 L^2}{12 t} \dots\dots\dots (1)$$

all terms expressed in the same units, in which

D = Deflection of a floor member under load test.

L = Span of member under load test.

t = The total thickness or depth of a member under load test.

If the deflection exceeds the value of D as given in formula (1), the construction shall be considered to have passed the test if within twenty-four hours after the removal of the load the member or portion of the structure shows a recovery of at least seventy-five per cent of the observed deflection.

1602.3 — SUPERVISION

All concrete work shall be supervised by the architect or engineer responsible for its design, or by a competent representative responsible to the architect or engineer. A record shall be kept of such supervision, which record shall cover the quality and quantity of concrete materials, the mixing and placing of the concrete, and the placing of the reinforcing steel. A complete record shall also be kept of the progress of the work and of the temperatures, when these fall below 40 degrees F., and of the protection given to the concrete while curing. This record shall be available for inspection by the Building Official at all times during the progress of the work and shall be preserved by the architect or engineer for two years after the completion of the work.

1602.4A- PORTLAND CEMENT

Portland cement shall conform to the "Standard Specifications for Portland Cement" (A. S. T. M. Serial Designation: C150-49).

1602.4B SLAG CEMENT

All slag cement that is used for making mortar or in a blend with Portland for concrete shall pass Manufacturers' Tentative Specifications for Slag Cement dated March 6, 1939, revised September 29, 1948.

1602.5 — CONCRETE AGGREGATES

(a) Concrete aggregates shall conform to the "Standard Specifications for Concrete Aggregates" (A.S.T.M. Serial Designation: C33-49 , provided however, that aggregates which have been shown by test or actual service to produce concrete of the required strength, durability, water-tightness, fire-resistance, and wearing qualities may be used under Section 1603.2 Method 2, where authorized by the

Building Official.

(b) The maximum size of the aggregate shall be not larger than one-fifth of the narrowest dimension between sides of the forms of the member for which the concrete is to be used nor larger than three-fourths of the minimum clear spacing between reinforcing bars.

1602.6 — WATER

Water used in mixing concrete shall be clean, and free from injurious amounts of oils, acids, alkalis, organic materials, or other deleterious substances.

1602.7 — METAL REINFORCEMENT

(a) Metal reinforcement shall conform to the requirements of the "Standard Specifications for Billet-Steel Bars for Concrete Reinforcement" (A.S.T.M. Serial Designation: A15-39), or for "Rail-Steel Bars for Concrete Reinforcement" (A.S.T.M. Serial Designation: A16-35), or for "Axle-Steel Bars for Concrete Reinforcement" (A.S.T.M. Serial Designation: A160-39).

(b) Cold-drawn wire or welded wire fabric for concrete reinforcement shall conform to the requirements of the "Standard Specifications for Cold-Drawn Steel Wire for Concrete Reinforcement" (A.S.T.M. Serial Designation: A82-34), or "Standard Specifications for Welded Steel Wire Fabric for Concrete Reinforcement" (A.S.T.M. Serial Designation: A185-37).

(c) Structural steel shall conform to the requirements of the "Standard Specifications for Structural Steel for Bridges and Buildings" (A. S. T. M. Serial Designation: (A7-44).

(d) Cast-iron sections for composite columns shall conform to the "Standard Specifications for Cast Iron Pit-cast Pipe for Water and Other Liquids" (A.S.T.M. Serial Designation: A44-41).

1602.8 — STORAGE OF MATERIALS

Cement and aggregates shall be stored in such a manner as to prevent deterioration or intrusion of foreign matter. Any material which has deteriorated or which has been damaged shall not be used for concrete.

SECTION 1603—CONCRETE QUALITY AND WORKING STRESSES

1603.1 — CONCRETE QUALITY

All plans, submitted for approval or used on the job, shall clearly show the assumed strength of concrete at a specified age for which all parts of the structure were designed.

1603.2 — DETERMINATION OF STRENGTH-QUALITY OF MATERIALS

The determination of the proportions of cement and water to attain the required strengths shall be made by one of the following methods:

Method 1—Concrete made from average materials:

When no preliminary tests of the materials to be used are made, the water-content per sack of cement shall not exceed the values in Table 1603.2. Method 2 shall be employed when artificial aggregates or admixtures are used.

Table 1603.2—Assumed Strength of Concrete Mixtures

Water-Content U. S. Gallons Per 94-lb. Sack of Cement	Assumed Compressive Strength at 28 Days—p. s. i.
5	3750
6	3000
6¾	2500
7½	2000

Note—In interpreting this table, surface water carried by the aggregate must be included as part of the mixing water in computing the water content.

Method 2—Controlled Concrete:

Water-content other than shown in Table 1603.2 may be used provided that the strength-quality of the concrete proposed for use in the structure shall be established by tests which shall be made in advance of the beginning of operations, using the consistencies suitable for the work and in accordance with the "Standard Method of Making Compression Tests of Concrete" (A. S. T. M. Serial Designation: C39-44). A curve representing the relation between the water-content and the average 28-day compressive strength or earlier strength at which the concrete is to receive its full working load, shall be established for a range of values including all the compressive strengths called for on the plans.

The curve shall be established by at least three points, each point representing average values from at least four test specimens. The maximum allowable water-content for the concrete for the structure shall be as determined from this curve and shall correspond to a strength which is fifteen per cent greater than that called for on the plans. No substitutions shall be made in the materials used on the work without additional tests in accordance herewith to show that the quality of the concrete is satisfactory.

1603.3 — CONCRETE PROPORTIONS AND CONSISTENCY

(a) The proportions of aggregate to cement for any concrete shall be such as to produce a mixture which will work readily into the corners and angles of the forms and around reinforcement with the

method of placing employed on the work, but without permitting the materials to segregate or excess free water to collect on the surface. The combined aggregates shall be of such composition of sizes that when separated on the No. 4 standard sieve, the weight passing the sieve (fine aggregate) shall not be less than thirty per cent nor greater than fifty per cent of the total, except that these proportions do not necessarily apply to light-weight aggregates.

(b) The methods of measuring concrete materials shall be such that the proportions can be accurately controlled and easily checked at any time during the work. * Measurement of materials for ready mixed concrete shall conform to the "Standard Specifications for Ready-Mixed Concrete" (A. S. T. M. Serial Designation: C94-44).

(c) When controlled concrete is used and the quality and strength have been determined by test as outlined by Method 2, Section 1603.2, the proportions of materials shall be determined at time of test, and a record of the tests and proposed proportions shall be filed with the Building Official for his approval.

1603.4—ALLOWABLE UNIT STRESSES IN CONCRETE

The unit stresses in pounds per square inch on concrete to be used in the design shall not exceed the values of Table 1603.4 where f'_c equals the minimum specified ultimate compressive strength at 28 days, or at the earlier age at which the concrete may be expected to receive its full load.

* Whenever practicable such measurement shall be by weight rather than by volume.

Table 1603.4—Allowable Unit Stresses in Concrete

DESCRIPTION	Allowable Unit Stresses					
	For Any Strength of Concrete as Fixed by Test in Accordance with Section 1603.2 $n = \frac{30000}{f'_c}$	When Strength of Concrete is Fixed by the Water-Content in Accordance with Section 1603.2				
		$f'_c = 2000$ p.s.i. $n=15$	$f'_c = 2500$ p.s.i. $n=12$	$f'_c = 3000$ p.s.i. $n=10$	$f'_c = 3750$ p.s.i. $n=8$	
Flexure: f_c						
Extreme fiber stress in compression	f_c	$0.45f'_c$	900	1125	1350	1688
Shear: v						
Beams with no web reinforcement and without special anchorage of longitudinal steel	v_c	$0.02f'_c$	40	50	60	75
Beams with no web reinforcement but with special anchorage of longitudinal steel	v_c	$0.03f'_c$	60	75	90	113
Beams with properly designed web reinforcement but without special anchorage of longitudinal steel	v	$0.06f'_c$	120	150	180	225
Beams with properly designed web reinforcement and with special anchorage of longitudinal steel	v	$0.12f'_c$	240	300	360	450
Flat slabs at distanced d from edge of column capital or drop panel	v_c	$0.03f'_c$	60	75	90	113
Footings	v_c	$0.03f'_c$	60	75	75	75
**Bond: u						
In beams and slabs and one-way footings:		but not to exceed 75 p.s.i.				
Plain bars	u	$0.04f'_c$	80	100	120	150
		but not to exceed 160 p.s.i.				

Table 1603.4—Allowable Unit Stresses in Concrete
(Continued)

DESCRIPTION	Allowable Unit Stresses					
	For Any Strength of Concrete as Fixed by Test in Accord- ance with Section 1603.2 30,000 $n=$ f'_c	When Strength of Con- crete is Fixed by the Water-Cement in Ac- cordance with Section 1603.2				
		$f'_c =$ 2000 p.s.i. $n=15$	$f'_c =$ 2500 p.s.i. $n=12$	$f'_c =$ 3000 p.s.i. $n=10$	$f'_c =$ 3750 p.s.i. $n=8$	
Deformed bars	u	$0.05f'_c$ but not to exceed 200 p.s.i.	100	125	150	188
In two-way footings: Plain bars (hooked)	u	$0.045f'_c$ but not to exceed 160 p.s.i.	90	113	135	160
Deformed bars (hooked)	u	$0.056f'_c$ but not to exceed 200 p.s.i.	112	140	168	200
Bearing: f_c						
On full area	f_c	$0.25f'_c$	500	625	750	938
On one-third area or less*	f_c	$0.375f'_c$	750	938	1125	1405

Footnotes—*The allowable bearing stress on an area greater than one-third but less than the full area shall be interpolated between the values given.

**Where special anchorage is provided (see Section 903 (a)), one and one-half times these values in bond may be used in beams, slabs and one-way footings, but in no case to exceed 200 p.s.i. for plain bars and 250 p.s.i. for deformed bars. The values given for two-way footings include an allowance for special anchorage.

ALLOWABLE UNIT STRESSES IN REINFORCEMENT

Unless otherwise provided in these Regulations, steel for con-

crete reinforcement shall not be stressed in excess of the following limits:

(a) Tension

(f_s = Tensile unit stress in longitudinal reinforcement)
and (f_v = Tensile unit stress in web reinforcement)

20,000 p.s.i. for Rail-Steel Concrete Reinforcement Bars, Billet-Steel Concrete Reinforcement Bars (of intermediate and hard grades), Axle-Steel Concrete Reinforcement Bars (of intermediate and hard grades), and Cold-Drawn Steel Wire for Concrete Reinforcement.

18,000 p.s.i. for Billet-Steel Concrete Reinforcement Bars (of structural grade), and Axle Steel Concrete Reinforcement Bars (of structural grade).

(b) Tension in One-Way Slabs of Not More Than 12 Feet Span

(f_s = Tensile unit stress in main reinforcement).

For the main reinforcement $\frac{3}{8}$ inch or less in diameter, in one-way slabs, 50 per cent of the minimum yield point specified in the Standard Specifications of the American Society for Testing Materials for the particular kind and grade of reinforcement used, but in no case to exceed 30,000 p.s.i.

(c) Compression, Vertical Column Reinforcement

(f_s = Nominal working stress in vertical column reinforcement).

Forty per cent of the minimum yield point specified in the Standard Specifications of the American Society for Testing Materials for the particular kind and grade of reinforcement used, but in no case to exceed 30,000 p.s.i.

(f_r = Allowable unit stress in the metal core of composite and combination columns):

Structural steel sections 16,000 p.s.i.

cast iron sections 10,000 p.s.i.

Steel pipe See (ACI 318-47)

1603.5 — TESTS ON CONCRETE

(a) The Building Official may require a reasonable number of compression tests to be made during the progress of the work. Such tests shall be made in accordance with the "Standard Method of Making and Storing Compression Test Specimens of Concrete in the Field" (A. S. T. M. Serial Designation C31-44), and cured in accordance with the requirements for laboratory control tests.

(b) Not less than three specimens shall be made for each test; nor less than one test for each 250 cu. yd. of concrete.

(c) The standard age of test shall be 28 days, but 7-day tests may be used provided that the relation between the 7- and 28-day strengths of the concrete is established by test for the materials and proportions used.

(d) Where the average strength of the laboratory control cylinders for any portion of the structure falls below the minimum ultimate compressive strengths called for on the plans, the Building Official shall have the right to order a change in the mixture or in the

water-content for the remaining portion of the structure. In cases where the average strength of the cylinders cured on the job falls below the required strength, the Building Official shall have the right to require conditions of temperature and moisture necessary to secure the required strength. If the average strength of either the laboratory control cylinders or the cylinders cured on the job falls below the required strength, load tests as specified in Section 1602.2 may be required on the portion of the structure so affected.

SECTION 1604—MIXING AND PLACING CONCRETE

1604.1 — PREPARATION OF EQUIPMENT AND PLACE OF DEPOSIT

(a) Before placing concrete, all equipment for mixing and transporting the concrete shall be cleaned, all debris and ice shall be removed from the spaces to be occupied by the concrete, forms shall be thoroughly wetted (except in freezing weather) or oiled, and masonry filler units that will be in contact with concrete shall be well drenched (except in freezing weather), and the reinforcement shall be thoroughly cleaned of ice or other coatings.

(b) Water shall be removed from place of deposit before concrete is placed unless otherwise permitted by the Building Official.

1604.2 — MIXING OF CONCRETE

(a) Unless otherwise authorized by the Building Official, the mixing of concrete shall be done in a batch mixer of approved type.

(b) The concrete shall be mixed until there is a uniform distribution of the materials and shall be discharged completely before the mixer is recharged.

(c) For job mixed concrete, the mixer shall be rotated at a speed recommended by the manufacturers and mixing shall be continued for at least one minute after all materials are in the mixer. A longer mixing period may be required for mixers larger than one cubic yard capacity.

(d) Ready-mixed concrete shall be mixed and delivered in accordance with the requirements set forth in the "Standard Specifications for Ready-Mixed Concrete" (A.S.T.M. Serial Designation C94-44).

1604.3 — CONVEYING

(a) Concrete shall be conveyed from the mixer to the place of final deposit by methods which will prevent the separation or loss of the materials.

(b) Equipment for chuting, pumping and pneumatically conveying concrete shall be of such size and design as to insure a practically continuous flow of concrete at the delivery end without separation of the materials.

1604.4 — DEPOSITING

(a) Concrete shall be deposited as nearly as practicable in its final position to avoid segregation due to rehandling or flowing. The concreting shall be carried on at such a rate that the concrete is at all times plastic and flows readily into the space between the bars. No concrete that has partially hardened or been contaminated by foreign materials shall be deposited on the work, nor shall retempered concrete be used.

(b) When concreting is once started, it shall be carried on as a continuous operation until the placing of the panel or section is completed. The top surface shall be generally level. When construction joints are necessary, they shall be made in accordance with Section 1605.8.

(c) All concrete shall be thoroughly compacted by suitable means during the operation of placing, and shall be thoroughly worked around the reinforcement and embedded fixtures and into the corners of the forms. Vibrators may be used to aid in the placement of the concrete provided they are used under experienced supervision, and the forms are designed to withstand their action.

(d) Where conditions make compacting difficult, or where the reinforcement is congested, batches of mortar containing the same proportions of cement to sand as used in the concrete, shall first be deposited in the forms to a depth of at least one inch.

1604.5 — CURING

In all concrete structures, concrete made with normal portland cement shall be maintained in a moist condition for at least the first seven days after placing and high-early-strength concrete shall be so maintained for at least the first three days.

1604.6 — COLD WEATHER REQUIREMENTS

(a) Adequate equipment shall be provided for heating the concrete materials and protecting the concrete during freezing or near-freezing weather. No frozen materials or materials containing ice shall be used.

(b) All concrete materials and all reinforcement, forms, fillers and ground with which the concrete is to come in contact, shall be free from frost. Whenever the temperature of the surrounding air is below 40 degrees Fahrenheit, all concrete when placed in the forms shall have a temperature of between 60 and 90 degrees Fahrenheit and shall be maintained at a temperature of not less than 50 degrees Fahrenheit for at least 72 hours for normal concrete or 24 hours for high-early-strength concrete, or for as much more time as is necessary to insure proper rate of curing of the concrete. The housing, covering or other protection used in connection with curing shall remain in place and intact at least twenty-four hours after the

artificial heating is discontinued. No dependence shall be placed on salt or other chemicals for the prevention of freezing. Manure, when used for protection, shall not be allowed to come into contact with the concrete.

SECTION 1605—FORMS AND DETAILS OF CONSTRUCTION

1605.1 — DESIGN OF FORMS

Forms shall conform to the shape, lines, and dimensions of the members as called for on the plans, and shall be substantial and sufficiently tight to prevent leakage of mortar. They shall be properly braced or tied together so as to maintain position and shape.

1605.2 — REMOVAL OF FORMS

Forms shall be removed in such manner as to insure the complete safety of the structure. Where the structure as a whole is supported on shores, the removable floor forms, beam and girder sides, column and similar vertical forms may be removed after twenty-four hours, providing the concrete is sufficiently hard not to be injured thereby. In no case shall the supporting forms or shoring be removed until the members have acquired sufficient strength to support safely their weight and the load thereon. The results of suitable control tests may be used as evidence that the concrete has attained sufficient strength.

1605.3 — PIPES, CONDUITS, ETC., EMBEDDED IN CONCRETE

Pipes which will contain liquid, gas or vapor at other than room temperature shall not be embedded in concrete necessary for structural stability or fire protection. Drain pipes and pipes whose contents will be under pressure greater than atmospheric pressure by more than one pound per square inch shall not be embedded in structural concrete except in passing through from one side to the other of a floor, wall or beam. Electric conduits and other pipes whose embedment is allowed shall not, with their fittings, displace that concrete of a column on which stress is calculated or which is required for fire protection, to greater extent than four per cent of the area of the cross section. Sleeves or other pipes passing through floors, walls or beams shall not be of such size or in such location as unduly to impair the strength of the construction; such sleeves or pipes may be considered as replacing structurally the displaced concrete, provided they are not exposed to rusting or other deterioration, are of uncoated iron or steel not thinner than standard wrought-iron pipe, have a nominal inside diameter not over two inches, and are spaced not less than three diameters on centers. Embedded pipes or conduits other than those merely passing through, shall not be larger in outside diameter than one-third the thickness of the slab,

wall or beam in which they are embedded; shall not be spaced closer than three diameters on centers, nor so located as unduly to impair the strength of the construction. Circular uncoated or galvanized electric conduit of iron or steel may be considered as replacing the displaced concrete.

1605.4 — CLEANING AND BENDING REINFORCEMENT

Metal reinforcement, at the time concrete is placed, shall be free from rust scale or other coatings that will destroy or reduce the bond. Bends for stirrups and ties shall be made around a pin having a diameter not less than two times the minimum thickness of the bar. Bends for other bars shall be made around a pin having a diameter not less than six times the minimum thickness of the bar, except that for bars larger than one inch, the pin shall be not less than eight times the minimum thickness of the bar. All bars shall be bent cold.

1605.5 — PLACING REINFORCEMENT

(a) Metal reinforcement shall be accurately placed and adequately secured in position by concrete or metal chairs and spacers. The minimum clear distance between parallel bars shall be one and one-half times the diameter for round bars and twice the side dimension for square bars. If special anchorage is provided, the minimum clear distance between parallel bars shall be equal to the diameter for round bars and one and one-half times the side dimensions for square bars. In no case shall the clear distance between bars be less than one inch, nor less than one and one-third times the maximum size of the coarse aggregate.

(b) When wire or other reinforcement, not exceeding one-fourth inch in diameter is used as reinforcement for slabs not exceeding ten feet in span, the reinforcement may be curved from a point near the top of the slab over the support to a point near the bottom of the slab at mid-span; provided such reinforcement is either continuous over, or securely anchored to the support.

1605.6 — SPLICES AND OFFSETS IN REINFORCEMENT

(a) In slabs, beams and girders, splices of reinforcement at points of maximum stress shall generally be avoided. Splices shall provide sufficient lap to transfer the stress between bars by bond and shear. In such splices the minimum spacing of bars shall be as specified in Section 1605.5.

(b) Where changes in the cross section of a column occur, the longitudinal bars shall be offset in a region where lateral support is afforded. Where offset, the slope of the inclined portion shall not be more than 1 in 6, and in the case of tied columns the ties shall be spaced not over three inches on centers for a distance of one foot below the actual point of offset.

1605.7 — CONCRETE PROTECTION FOR REINFORCEMENT

(a) The reinforcement of footings and other principal structural members in which the concrete is deposited against the ground shall have not less than three inches of concrete between it and the ground contact surface. If concrete surfaces after removal of the forms are to be exposed to the weather or be in contact with the ground, the reinforcement shall be protected with not less than two inches of concrete for bars more than $\frac{1}{2}$ inch in diameter and one and one-half inches for bars $\frac{1}{2}$ inch or less in diameter.

(b) The concrete protective covering for reinforcement at surfaces not exposed directly to the ground or weather shall be not less than three-fourths inch for slabs and walls; and not less than one and one-half inches for beams, girders and columns. In concrete joist floors in which the clear distance between joists is not more than thirty inches, the protection of metal reinforcement shall be at least three-fourths inch.

(c) If this code specifies (Chapter X), as fire-protective covering of the reinforcement, thickness of concrete greater than those given in this section, then such greater thickness shall be used.

(d) Concrete protection for reinforcement shall in all cases be at least equal to the diameter of round bars, and one and one-half times the side dimension of square bars.

(e) Exposed reinforcement bars intended for bonding with future extensions shall be protected from corrosion by concrete or other adequate covering.

1605.8 — CONSTRUCTION JOINTS

(a) Joints not indicated on the plans shall be so made and located as to least impair the strength of the structure. Where a joint is to be made, the surface of the concrete shall be thoroughly cleaned and all laitance removed. In addition to the foregoing, vertical joints shall be thoroughly wetted but not saturated, and slushed with a coat of neat cement grout immediately before placing of new concrete.

(b) At least two hours must elapse after depositing concrete in the columns or walls before depositing in beams, girders, or slabs supported thereon. Beams, girders, brackets, column capitals, and haunches shall be considered as part of the floor system and shall be placed monolithically therewith.

(c) Construction joints in floors shall be located near the middle of the spans of slabs, beams, or girders, unless a beam intersects a girder at this point, in which case the joints in the girders shall be offset a distance equal to twice the width of the beam. In this last case provision shall be made for shear by use of inclined reinforcement.

CHAPTER XVII

WOOD CONSTRUCTION PRACTICE, DESIGN AND QUALITY

SECTION 1700—GENERAL

The first part of this Chapter is concerned with construction practices and the second part with design and quality.

1700.1 — GENERAL

(a) The quality and design of all wood members used for load supporting purposes in buildings or other structures shall conform to the standards hereinafter specified.

(b) All members shall be so framed, anchored, tied and braced together as to develop the strength and rigidity necessary for the purpose for which they are used.

1700.2 — DETERMINATION OF REQUIRED SIZES

(a) All wood structural members shall be of sufficient size to carry the dead and required live loads without exceeding the allowable working stresses as hereinafter specified.

(b) Minimum sizes of lumber members required by this Code refer to nominal sizes. American Lumber Standard dressed sizes shall be accepted as the minimum net sizes conforming to nominal sizes. Computations to determine the required sizes of members shall be based on the net dimensions (actual size) and not the nominal sizes. If rough sizes or finish sizes exceeding American Lumber Standard dressed sizes are to be used, computations may be predicated upon such actual sizes, provided they are specified on the plans or in statement appended thereto. For convenience, nominal sizes may be shown on the plans.

(c) The Building Official may require the species and grade or the stress-grade of all lumber used for load bearing purposes to be stated on the plans filed with the Building Department.

SECTION 1701—CONSTRUCTION PRACTICES

1701.1 — PREPARATION OF BUILDING SITE

All building sites shall be graded so as to provide drainage under all portions of the building not occupied by basements or cellars. All stumps and roots shall be removed from the soil to a depth of at least twelve (12) inches.

1701.2—REMOVAL OF DEBRIS

After all work is completed loose wood and debris shall be completely removed from all spaces under the building. All wood forms and supports shall be completely removed. Loose or casual wood shall not be stored in contact with the ground under any building.

1701.3 — FOUNDATIONS

Foundations shall be designed and constructed in accordance with the provisions of Section 1302. Where spot piers are used in one and two family dwellings, spacing of such piers shall not exceed eight (8) Ft. center to center. The top of every masonry or concrete foundation, wall or pier, which supports and is in contact with wood construction of any kind shall be not less than six (6) inches above the finished grade.

1701.4 — MUD SILLS

A one (1) story building, except a dwelling, which does not exceed six hundred (600) Sq. Ft. in area, may be constructed without a masonry or reinforced concrete foundation, providing such building is placed on an eighty-five (85) per cent heart by girth measurement, redwood, dense Southern yellow pine, cedar or tidewater cypress or on a pressure creosoted wood sill. No mud sill shall be less than nominal two inches by six inches (2x6) or three inches by four inches (3x4) in cross section.

1701.5 — FOUNDATION WALL VENTS

Space under first floor joists, except in such space as is occupied by a basement or cellar, shall be provided with openings to insure ventilation. Such ventilating openings shall be proportioned on the basis of not less than one and one-half (1½) Sq. Ft. net opening for each fifteen (15) lineal feet or major fraction thereof of exterior wall. Vents shall be so placed as to provide ventilation at all points and prevent dead air pockets; they need not be placed in the front of the building. Such openings shall be screened with not less than one-half (½) inch mesh galvanized hardware cloth.

1701.6 — CLEARANCE

There shall be clearance of not less than eighteen (18) inches between the bottom of untreated wood framing and the ground beneath; except as provided in Section 1701.4 and Section 1701.7.

1701.7 — SILLS AND TOE PLATES

All masonry shall be finished to provide a true and even bearing surface for wooden structural members. Such structural members shall be securely fastened to the masonry or concrete bearing surface. All sills and plates (except dwellings) shall be bolted with not less than one-half (½) inch diameter bolts securely embedded in the masonry and spaced not more than six (6) feet apart.

All wood sills and plates, less than 18 inches from the ground shall be the heartwood of a durable species as listed in Section 1701.4 or shall be the pressure treated with approved preservatives, all untreated wood sills in contact with masonry or concrete 18 or more inches above the ground shall be isolated from such masonry or concrete with twenty-four (24) U. S. Standard gauge galvanized iron or other approved non-corrodible metal, or such sills and plates shall be bedded in 1:3 cement mortar.

SECTION 1702—VERTICAL MEMBERS

1702.1 — COLUMNS AND POSTS

All wood column and posts supporting loads shall be framed to true end bearings; shall extend downward to supports of such design as to hold the column or post securely in position and to protect its base from deterioration. Bottom or lowest tiers shall be supported at least two (2) inches above grade, or finish floor, by masonry or concrete footings and separated there from by a metal plate not less than one-quarter ($\frac{1}{4}$) inch thick; shall not rest directly or indirectly on floor beams except in cases where there is no column below; shall not exceed load limitations as specified in Section 1707.

Untreated wood columns in basements, when built into masonry partitions or walls, shall be exposed on at least two (2) sides.

Wood posts and timbers, when used in contact with and below ground, (except for minor or temporary structures, or where permanently below lowest ground water level) shall be of heart-wood of a decay-resistant species or of approved creosoted pressure-treated material.

1702.2 — STUD WALLS AND PARTITIONS

The maximum allowable height for nominal size two by four (2x4) inch studding for bearing walls or partitions shall be fourteen (14) feet and for two by six (2x6) inch nominal size twenty (20) feet, spaced not more than sixteen (16) inches on center, unless the wall is supported laterally by adequate framing in a horizontal direction perpendicular to the direction of the stud wall, or each stud is designed as a column with stresses not exceeding those allowed by this Chapter.

Bearing walls and partitions of residential buildings supporting more than two floors and a roof and of other buildings supporting more than one story and roof shall have lowest tier of studs not less than two by six (2x6) inches in nominal size.

Where studding extends through more than one floor, the floor joist of the second floor may be supported by a one by four (1x4) inch nominal size ribbon, notched into the studs and securely nailed.

In bearing partitions or walls, studs shall be provided with top and bottom plates lapped at each intersection. Single bottom plates may be used. Single top and bottom plates shall be permitted for non-bearing walls and partitions. Joints shall be staggered not less than two (2) feet; and such plates shall be not less in size than the studding.

In non-bearing walls and partitions studs may be spaced not more than twenty-eight (28) inches on centers, and may be set with long dimension parallel to the wall.

Angles at corners where stud walls or partitions meet shall be framed solid so no lath can extend from one room to another. All exterior- and main cross stud partitions shall be effectively and thoroughly angle braced.

Where studs pass through from floor to floor they shall be fire-stopped at point of passage through floors in conformance to the provisions of Section 1702.6.

1702.3 — PROTECTION OF OPENINGS

Openings in partitions and walls shall be framed around with double studs at each side and double headers across the top resting on the short stud at each end, unless other equal approved method of framing is used.

The double header shall be placed on edge and shall be trussed above all openings over four (4) feet in width, or where more than two (2) studs are cut away.

1702.4 — CORNER BRACING

Studs shall be doubled or tripled at corners of exterior walls and such corners shall be braced by a let-in one by four (1x4) inch or one by six (1x6) inch continuous diagonal brace, extending from the top plate to the bottom plate at a forty-five degree angle. Where windows, or other openings, preclude use of such bracing, alternative bracing approved by the Building Official may be used. Where "Solid Sheathing" of walls is of lumber applied diagonally, or where plywood sheathing at least 5/16 inch thick and properly nailed with 6 penny common nails 6 inches on centers around the edges and 12 inches on centers or other bearings is used, let-in bracing may be omitted.

1702.5 — CLEARANCE FOR PIPES

Stud walls containing plumbing, heating or other pipes shall be so framed as to allow proper clearance for such pipes. Where a partition containing such pipes runs parallel to the floor joists, the floor joists under such partitions shall be doubled and spaced to provide clearance for such pipes and shall be bridged with solid bridging. Where plates or soles are cut to permit passage of such pipes, a metal tie not less than one-eighth ($\frac{1}{8}$) inch thick and one and one-half ($1\frac{1}{2}$) inch wide shall be fastened to the plate across and to each side of the opening with not less than four (4) 16d nails.

1702.6 — FIRESTOPPING

Firestopping shall be provided to cut off all vertical and horizontal concealed draft openings. Firestopping shall be as indicated in this Section and as provided in Section 705.

Firestopping, when of wood, shall be of not less than two (2) inch nominal thickness and shall effectively fill all spaces to the entire width of the framing or structural members.

Firestopping, when of other materials, shall be of formed coated steel of not less than twenty (20) U. S. Standard Gauge, securely and tightly nailed, or, in the case of spaces between chimneys, and wood

framing, such spaces shall be solidly filled with mortar or loose incombustible matter supported on non-combustible supports.

Firestopping shall be used in the following locations:

1. In all stud walls, partitions and furred spaces, so that no concealed space exceeds eight (8) feet in length.
2. In all stud walls at ceiling and floor levels.
3. Between stair stringers at least once in the middle of each run, at the top and the bottom, and between studs, along and in line with the adjoining run of stairs.
4. Between chimneys, fireplaces and wood framing.
5. Around the top, bottom and side of sliding door pockets.
6. Any other spaces not specifically mentioned above which would allow the passage of flame.

1702.7 — FLASHING

Every exterior opening shall be flashed with coated steel or with non-corrodible sheet metal in such manner as to be waterproof.

SECTION 1703—HORIZONTAL MEMBERS

1703.1 — ANCHORAGE

Anchors for each tier of joists and rafters shall be provided where they enter masonry walls and where they are parallel to masonry walls. Such anchors shall be of metal of an approved type and spaced not more than six (6) feet apart. Such anchors shall, in all cases, occur on the opposite end of the same run of joists. Ends of joists shall be lapped and spiked so as to form a continuous tie across the building.

1703.2 — CUTS AND BORE HOLES

Cuts and bore holes in wood girders, beams or joists shall be not deeper than one-fifth ($1/5$) the beam depth below its top and not further from the beam end than three (3) times the beam depth. Any cut that does not conform to above limitations, or bore holes two (2) inches or more in diameter are not permitted without special provisions for reinforcing the beam. Such reinforcement shall be approved by the Building Official.

1703.3 — GIRDERS, BEAMS AND TRUSSES

The design, quality and strength of girders, beams and trusses shall be in accordance with Section 1707.

1703.4 — BEARING

All masonry shall be finished to provide a true and even bearing surface for wooden structural members. Girders and beams entering or bearing on masonry shall have at least four (4) inches of end bearing, firecut three (3) inches, and shall be separated from the opposite side of the wall, or from members entering from the opposite side of the wall by at least four (4) inches of solid masonry. Girders and beams shall be provided with metal wall boxes of an approved type

which will provide air space of at least one-half ($\frac{1}{2}$) inch on sides and top, or wall bearing plates and anchors, so set as to provide at least one (1) inch of air space around sides and end; or may be sealed in if timbers are protected by an approved preservative treatment (See Appendix).

1703.5 — TRUSSES

Timber trusses shall be securely anchored to the wall at all points of bearing. Members shall not be stressed in excess of stresses provided for in Section 1707.

Wood trusses and truss framing shall have all joints accurately cut and fitted together so that each bearing is true and drawn tight to the full bearing. All trusses shall be properly secured in place by lateral bracing.

Washers of sufficient size to distribute the loads properly shall be used in connection with rods or metal members. Before a truss is loaded, the tension rods shall be well tightened.

SECTION 1704—JOISTS

1704.1 — JOISTS

Floor joists shall be so designed as to adequately sustain all imposed live loads as set forth in Section 1203. For allowable span and spacing of joists the following references are given:

1. For one and two family dwellings:

Section 1704.6, Joists of other species, grades, or sizes may be used when properly designed.

2. For all loadings other than above, design shall be in accordance with Section 1707.

1704.2 — BEARING

Floor joists shall be supported by sill, girders, bearing partitions or exterior walls. Where entering exterior stud walls, the joists shall be supported on a plate or, if no plate is provided, by a one by four (1x4) inch nominal size ribbon let in the studs. Joists shall be well nailed to the supporting studs. Studs shall be doubled under the ends of doubled joists. Where joists enter or bear on masonry see Section 1703.4.

1704.3 — HEADER JOISTS

Header and trimmer joists more than four (4) feet long shall be doubled. Header joists over six (6) feet long and tail joists over twelve (12) feet long shall be hung in approved stirrup irons or joist hangers or approved equivalent.

1704.4 — JOISTS UNDER PARTITIONS

Joist under and parallel to bearing partition walls shall be doubled and well spiked so as to form a solid beam. Where clearance for pipes is necessary solid bridging not more than sixteen inches on centers shall be provided (Section 1702.5).

1704.5 — BRIDGING

Cross bridging shall be placed between joists if the span is over eight (8) feet. The distance between bridging or between bridging and bearing, shall not exceed eight (8) feet. Wood cross bridging used in one and two family dwellings shall be not less than one by three (1x3) inches nominal size cross sectional area, but in other buildings shall be not less than one by six (1x6) inches or two by three (2x3) inches nominal size. Metal cross bridging of equal or greater strength may be used in place of wood cross bridging.

Solid bridging shall be placed between floor joists at all supports.

1704.6 — MAXIMUM ALLOWABLE SPANS

Table No. 1704.6 gives the maximum allowable spans, according to spacing shown, for floor joists based on 1100 lb. f, and E of 1,600,000 and based on a live load of 40 and 30 lbs. per square foot uniformly distributed. Spans for joists with plastered ceilings are based on deflection or stress, whichever is the lesser.

Floor joists of other grades, or of other sizes, may be used provided they are not stressed to exceed the maximum allowable working stress as shown in Table No. 1707.

**TABLE 1704.6—MAXIMUM ALLOWABLE SPAN BETWEEN
SUPPORTS FOR WOOD JOISTS**

Joist Size (Nominal) In Inches	Joist Spacing Center To Center In Inches	Maximum Allowable Span

*THIRTY POUNDS PER SQUARE FOOT LIVE LOAD IS FOR ONE-STORY DWELLINGS. FORTY POUNDS PER SQUARE FOOT LIVE LOAD IS FOR OTHER OCCUPANCIES HAVING THAT REQUIREMENT.

1704.7 — CEILING JOISTS AND ROOF RAFTERS (DWELLINGS)

Table 1704.7, gives the allowable spans, according to spacings shown, for ceiling joists (plastered,—no live load in attic) and roof rafters (light weight roofing), using Grade of Lumber based on eleven hundred (1100) Lb./Sq. In. fiber stress.

Ceiling joists and rafters of other grades or other sizes, or for other loads may be used, provided they are properly designed, in accordance with Section 1707.

The span of roof rafters shall be measured from plate to ridge, except that where rafters are braced to ceiling joists so that a complete truss is formed the span may be taken as the distance between the intersecting points of trussing.

TABLE NO. 1704.7
MAXIMUM SPANS OF CEILING JOISTS AND ROOF RAFTERS

Size of Joist (Nominal) Inches	Spacing of Joist Center to Center Inches	Maximum Allowable Span			
		Ceiling Joists Plastered No live load		Roof Rafters (For Dwellings)	
		Ft.	In.	Ft.	In.
2 x 4	12	11	0	11	0
	16	10	1	9	7
	24	8	11	7	11
2 x 6	12	16	7	16	9
	16	15	4	14	8
	24	13	8	12	2
2 x 8	12	21	7	21	10
	16	20	1	19	3
	24	17	11	16	0

1704.8 — ROOF FRAMING AND SHEATHING

Roof framing and trussing shall be thoroughly and effectively braced. Roof joists or rafters, when supported on a ribbon board, shall be well nailed to the stud.

VALLEY RAFTERS—Valley rafters shall be not less than one and five-eighths by five and one-half inches (1 $\frac{5}{8}$ "x5 $\frac{1}{2}$ ") in size.

SHEATHING—Open sheathing shall be not less than one by four inch (1"x4") nominal size, set not more than eight (8) inches on center and nailed with not less than two (2) 8d nails to each supporting rafter.

PLYWOOD ROOF SHEATHING

Plywood roof sheathing shall be of the minimum thicknesses specified in Table below:

Plywood Thickness (Inches)	Live Load, pound per sq. ft.	
	20	40
5/16	18 inch span	12 inch span
3/8	22 inch span	16 inch span
1/2	27 inch span	21 inch span
5/8	33 inch span	24 inch span

The plywood shall be applied with its face grain perpendicular to rafters. Plywood roof sheathing unless of Exterior type, shall have no surface or edge exposed to weather.

ROOF COVERING—Any roof covering permitted in this Code may be applied to dwellings. (See Chapter VII Fire Protection Requirements, Section 706, Roof Coverings). Wherever composition roofing is used, solid sheathing shall be applied.

FLASHING—Flashing shall be placed around openings and extensions of mechanical appliances or equipment through the roof.

1704.9 — SCUTTLES

All buildings shall have a scuttle or opening through the ceiling into the roof attic. Such opening shall be not less than two (2) feet by three (3) feet in dimensions. Scuttle openings shall be provided with a lid that does not require any special effort to remove or open.

SECTION 1705—WALLS—EXTERIOR PROTECTION

1705.1 — FIRE-RESISTIVE RATING

Where fire-resistive walls are required, exterior wall construction shall conform to the requirements of Chapter X, Fire-Resistive Ratings.

1705.2 — SHEATHING

Sheathing shall be applied on the exterior walls of all Type VI buildings more than one story in height, except when back-plastered stucco construction is used.

Sheathing, where required for exterior walls, shall be applied solidly over the wall surface and shall be one or more of the following materials:

1. Wood not less than five-eighths inch ($\frac{5}{8}$ ") thick.
2. Fiber board not less than seven-sixteenths inch ($\frac{7}{16}$ ") thick.
3. Gypsum not less than one-half inch ($\frac{1}{2}$ ") thick.
4. Plywood not less than five-sixteenths inch ($\frac{5}{16}$ ") thick.

1705.3 — WALL COVERINGS

Outer wall coverings of exterior walls shall be of the materials applied in the manner specified in this section.

(a) **Weatherboarding.** Wood siding when in place shall have an average thickness of not less than five-eighth inch ($\frac{5}{8}$ "), Bevel drop siding shall have a butt thickness of not less than twenty-one thirty-seconds ($\frac{21}{32}$) and a tip thickness of not less than one quarter ($\frac{1}{4}$) inches. Siding of less than these dimensions may be applied, provided the outside face of the stud is covered with solid sheathing, as provided in this section.

(b) **Shingles or Shakes.** The minimum thickness of wood shingles or shakes between nailing boards shall be not less than three-eighth ($\frac{3}{8}$) inches. Shingle nailing boards shall be securely nailed to each stud with two (2) 8d nails.

(c) **Plywood.** Plywood shall be of the exterior type and shall have a minimum thickness of three-eighths ($\frac{3}{8}$) inches. Where three-ply plywood is applied without sheathing the exterior ply shall be perpendicular to the studding. All plywood joints shall be backed solidly with nailing pieces of not less than two (2) inches in width.

(d) **Asbestos Shingles.** Asbestos shingles shall have a minimum thickness of five thirty-second ($\frac{5}{32}$) inches.

(e) **Masonry Veneer.** Masonry veneer shall conform to the requirements of Chapter XIV—Masonry and Veneered Walls. Brick Veneer (clay, sand lime or concrete) shall have a minimum thickness of two (2) inches for one story only and not less than four (4) inches for more than one story. Brick or other unit veneers shall be backed with solid sheathing covered with waterproof building paper except where the sheathing is water-repellant and is so labeled. Brick veneer shall be securely attached to the structure at intervals of not more than sixteen (16) inches vertically and thirty-two (32) inches horizontally with non-ferrous metal ties or galvanized 40d nails.

(f) **Other Veneers.** All veneers other than brick shall conform to the requirements of Chapter XIV Masonry and Veneered Walls.

(g) **Stucco.** Stucco or exterior plaster shall conform to requirements of Section 1807.

(h) **Metal.** Exterior wall coverings may be of formed metal not less than twenty-eight (28) U. S. Standard Gauge.

(i) **Solid Masonry.** Solid masonry walls shall conform to the requirements of Chapter XIV, Masonry and Veneered Walls.

SECTION 1706—CONNECTIONS

1706.1 — GENERAL

All connections shall be such as to develop the full strength and rigidity of members connected. The provisions of this section shall apply.

1706.2 — SAFE LATERAL STRENGTH OF NAILS

TABLE NO. 1706.2

SAFE LATERAL STRENGTH OF COMMON WIRE NAILS

Driven Perpendicular to the Grain of the Wood, in pounds per Nail

Kind of Wood	Size of Nail									
	6d	8d	10d	12d	16d	20d	30d	40d	50d	60d
Length of Nail	2"	2½"	3"	3¼"	3½"	4"	4½"	5"	5½"	6"
Southern Pine or Douglas Fir	63	78	94	94	108	139	156	176	200	222
Other Species	As determined by the Building Official									

1706.3—SAFE RESISTANCE TO WITHDRAWAL

A wire nail driven perpendicular to the grain of the wood shall not be subjected to a greater load, tending to cause withdrawal, than the safe resistance of the nail to withdrawal, as set forth in Table No. 1706.3.

Nails driven parallel to the grain of the wood shall not be allowed for resisting computed tensile stresses.

TABLE NO. 1706.3

SAFE RESISTANCE TO WITHDRAWAL OF COMMON WIRE NAILS

Driven Perpendicular to the Grain of the Wood, in Pounds per Linear Inch of Penetration into the Main Member

Kind of Wood	Size of Nail									
	6d	8d	10d	12d	16d	20d	30d	40d	50d	60d
Sou. Pine Longleaf	41	47	54	54	56	60	66	71	77	83
Sou. Pine Shortleaf	34	38	43	43	46	49	53	58	62	68
Douglas Fir	29	34	38	38	42	49	53	58	62	67
Other Species	As determined by the Building Official									

1706.4 — SPACING AND PENETRATION OF NAILS

Nails shall not be driven closer together than one-half their length unless driven in bored holes nor closer to the edge of the timber than one-quarter their length. Holes for nails when necessary to prevent splitting shall be bored of diameter smaller than that of the nails. Nails shall be of such length that, when joining one timber to another, the penetration of the nail into the second or farther timber shall be not less than one-half the length of the nail.

1706.5 — WASHERS

All bolts in direct tension shall be provided with steel plate washers under heads and nuts. The area of these washers must be such that the unit bearing stress on the wood shall not exceed the allowable unit stress. The washer shall be not less in thickness than one-tenth the diameter or the length of the longer side of the washer.

Bolts taking shear only shall have Standard O. G. Malleable Iron washers, or equivalent, under head and nuts.

1706.6 — BOLTED JOINTS

Joints in which bolts are used to resist stresses in wood structures shall be designed in accordance with the principles set forth in the "National Design Specification for Stress-Grade Lumber and its Fastenings—1948", of the National Lumber Manufacturers Association.

1706.7 — TIMBER CONNECTORS

Joints wherein timber connectors are used to transmit stresses between structural or load-bearing members shall be designed in accordance with the principles set forth in the "National Design Specification for Stress-Grade Lumber and Its Fastenings—1948," of the National Lumber Manufacturers Association.

SECTION 1707—LUMBER STRUCTURAL DESIGN, QUALITY AND STRENGTH

1707.1 — ALLOWABLE UNIT STRESSES

(a) Stresses, in pounds per square inch, shall not exceed the allowable working stresses, except as herein modified, for the respective species and grades set out in the following Tables; provided, however, other stress grades may be approved, and stresses for species and grades not given in the following tables shall be established, by the Building Official, in accordance with the principles set forth in the "National Design Specification for Stress-Grade Lumber and Its Fastenings—1948" of the National Lumber Manufacturers Association.

(b) Stresses given in tables 1707 shall be used only when a selected species is identified by the grade mark of a lumber grading or inspection bureau or agency recognized as being competent.

(c) Stresses for joist and plank grades apply to material with the load applied to either the narrow or wide faces.

(d) The allowable unit stresses in Table No. 1707 may be increased by 25 per cent for snow loading combined with dead load, and 33 1/3 per cent for wind loading. Where maximum snow load remains permanently on the structure, the allowable stresses shall not be increased. For other loading not exceeding a duration of 5 minutes, the allowable stresses may also be increased by 33 1-3 per cent. The above increases are not cumulative. For wind in combination with permanent loading, the allowable unit stresses in Table No. 1707 may be increased by 33 1-3 per cent, provided that the resulting structural members are not smaller than those required for permanent loading alone. The provisions of this paragraph do not apply to the modulus of elasticity. These increases apply to mechanical fastenings except as other wise noted.

(e) In computing shear all loads within a distance from either support equal to the depth of the beam may be neglected. All concentrated loads located at a distance from the support of one to three times the depth of the beam may be considered as placed at three times the depth of the beam from the support or at the quarter-point, whichever is closer to the support. All other loads shall be considered in the usual manner.

(f) Shearing stress for joint details may be taken as fifty per cent (50%) greater than the horizontal shear values otherwise permitted.

In computing the horizontal shear in eccentric joints the depth of the member shall be assumed as reduced by the distance between the unloaded edge of the member and the nearest edge of the connector. Where bolts alone are used, the depth shall be reduced by the distance between the unloaded edge and the center of the bolt.

(g) In joists supported on a ribbon or ledger board and spiked to the studding, the allowable stress in compression perpendicular to the grain may be increased fifty per cent (50%).

(h) Allowable compression stresses perpendicular to grain may be increased in accordance with the following factors for bearings less than six (6) inches in length and located three (3) inches or more from the end of a timber:

Length of bearing (inches)	½	1	1½	2	3	4	6 or more
Factor	1.75	1.38	1.25	1.19	1.13	1.10	1.00

For stress under a washer or small plates the same factor may be taken as for a bearing, the length of which equals the diameter of the washer.

(i) Compression on surfaces inclined to grain shall be limited according to the following formula:

$$N = \frac{cq}{c \sin^2 \phi + q \cos^2 \phi} \quad \text{in which,}$$

N = Allowable unit stress on the inclined surface

c = unit stress in compression parallel to the grain

q = unit stress in compression perpendicular to the grain

ϕ = angle in degrees between the direction of the load and the direction of the grain.

1707.2 — TIMBER COLUMN FORMULA

The following formulas apply to solid timber columns and other solid members stressed in compression parallel to grain:

(a) **Short Columns.** The safe load, in pounds per square inch of actual cross-sectional area for solid columns, and other solid members stressed in compression parallel to the grain, with a ratio of unsupported length to least dimension (l/d) not exceeding eleven (11) (short columns) shall not exceed the allowable unit compression stress parallel to grain for short columns, i.e., $P/A = c$.

(b) Intermediate columns. For solid columns with a ratio of unsupported length to least dimension greater than eleven (11) (intermediate columns), the following formula shall be used until the reduction in allowable stress equals one-third (1/3) the stress permitted for short columns:

$$\frac{P}{A} = c \left[1 - \frac{1}{3} \left(\frac{l}{Kd} \right)^4 \right] \text{ in which}$$

$$K = \frac{P_i}{2} \sqrt{\frac{E}{5c}} = .702 \sqrt{\frac{E}{c}}; \text{ at which } \frac{P}{A} = \frac{2c}{3}$$

(c) Long Columns. For solid columns with a ratio of unsupported length to least dimension greater than K, (long columns); the safe load shall be determined by the following formula:

$$\frac{P}{A} = \frac{329 E}{\left(\frac{l}{d} \right)^2}$$

(d) Notation:

P = total load in pounds.

A = area in square inches of actual cross-section.

P/A = the working stress or maximum load per square inch.

c = allowable unit stress in compression parallel to grain.
(Table 1707)

l = unsupported length of column in inches.

d = least dimension of column in inches.

E = modulus of elasticity.

K = minimum value of l/d at which the column will behave as a long (Euler) column.

(e) Solid columns shall be limited in maximum length to l/d=50

(f) **Spaced Member Columns.** Columns formed of two or more individual side members separated by blocking at the ends and middle points of their lengths and joined at the ends by approved timber connectors shall be designed using column formulas recommended by the Forest Products Laboratory, Forest Service, U. S. Department of Agriculture and the "National Design Specification for Stress-Grade Lumber and Its Fastenings—1948" of the National Lumber Manufacturers Association.

(g) The individual members of spaced columns shall be limited in maximum length to l/d=80.

CHAPTER XVIII

LATHING AND PLASTERING

SECTION 1800—GENERAL

1800.1—Scope

All lathing and plastering shall conform to the requirements of this Chapter and shall be limited to the materials specified in this Chapter; provided, further, that lathing and/or plastering required as a fire protection measure shall also conform with the provisions of Chapter X, "Fire-Resistive Materials and Construction."

SECTION 1801—INSPECTION

1801.1—Interior and Exterior Lathing and Plastering

All lathing and backing in connection with fire protection or fire rating requirements shall be inspected and approved before the application of any plaster and/or stucco by the Building Official. At least once during the course of plaster and/or stucco application the plaster and/or stucco material, mixes and application, shall be inspected for conformance with the requirements of this Chapter, and approval for continuance of the job shall be given only if all such requirements are being complied with.

Test holes may be made for the purpose of determining the thickness of the plaster at the discretion of the Building Official, but the permit holder shall be notified 24 hours in advance of the time of making such tests.

SECTION 1802—MATERIALS

1802.1 — Wood Lath

Wood lath shall conform to the requirements of Section 13 of A.S.A. "Standard Specifications for Gypsum Plastering, Including Requirements for Lathing and Furring," designation A42.1-1946.

1802.2—Fiber Insulation Lath

Fiber insulation lath shall conform to the requirements of Section 13 of A.S.A. "Standard Specifications for Gypsum Plastering, Including Requirements for Lathing and Furring," designation A-42.1-1946.

1802.3—Gypsum Lath

Gypsum lath shall comply with provisions of the Standard Specifications for Gypsum Lath (ASA A67.1-1942, ASTM C37-42). Where one-hour fire resistance is required, perforated gypsum lath shall have perforations not less than $\frac{3}{4}$ inch in diameter with one perforation to not more than 16 Sq. In. of lath.

1802.4—Metal Lath and Wire Lath

(a) Metal lath and wire lath, metal accessories and channels shall conform to the requirements of Section 13 of A.S.A. "Standard Specifications for Gypsum Plastering, Including Requirements for Lathing and Furring," (A42.1-1946).

(b) Paper back wire lath shall be not less than 16-W and M Gauge Zinc-coated wire, with mesh not to exceed 2x2 inch with stiffener.

1802.5—Gypsum Plaster

Gypsum Plaster shall conform to A.S.T.M. "Standard Specifications for Gypsum Plaster", designation C28-40.

1802.6—Sand

Sand shall conform to A.S.T.M. "Standard Specifications for Sand for Use in Plaster", designation C35-39.

1802.7—Portland Cement

Portland Cement shall conform to A. S. T. M. "Standard Specifications for Portland Cement", designation C150-44. Approved types of plasticity agents may be added to Portland Cement in the manufacturing process or when mixing the plaster.

SECTION 1803—INTERIOR APPLICATION OF LATH

1803.1—Spacing of Supports

Weights of metal lath and wire lath and the corresponding spacing of supports shall conform to the requirements set forth in Table 1803.1.

Spacing of supports for gypsum, wood, and fiber insulation lath shall not exceed 16 inches.

TABLE 1803.1

Type of Lath	Minimum Wgt. (Lbs. per Sq. Yd.)	Max. Spacing of Vertical Supports	Supports (In.)* Horiz. Supports
Flat Expanded Metal Lath	2.5 3.4	16 16	0 16
Flat Rib Metal Lath	2.75 3.4	16 24	16 19
¾" Rib** Metal Lath	3.4	24	24
Wire Fabric	***	16	16
Wire Lath	2.48	16	13½

* Lath may be used on any spacings, center to center, up to the maximum shown for each type and weight.

** Rod-ribbed or V-stiffened metal lath of equal rigidity and weight is permissible on same spacings as ¾-inch rib metal lath.

*** Paper-backed wire fabric shall be No. 16 gauge wire, 2x2 inch mesh, with stiffener.

1803.2—Wood Lath

Wood lath shall be spaced approximately ¾-inch apart at the edges, and ¼-inch apart at ends. Lath shall be nailed securely at right angles to wood supports with 3d fine No. 16 gauge blued nails, full driven. Joints shall be broken as follows: Every seventh lath, and below and above all openings. Wood lath shall not be used, where a specified fire rating is required.

1803.3—Gypsum Lath

Gypsum lath shall be securely nailed to wood supports at intervals not to exceed 4 inches with No. 13 gauge, 1½ inch, ¾ inch flat head, blued nails. Joints between walls and ceilings shall be staggered. Lath shall be applied with the long dimension at right angles to the framing members, with joints broken in each course. Lath shall not be butted tightly together, nor be more than ¼-inch apart. Gypsum lath shall be attached to metal supports by means of approved special clips.

1803.4—Fiber Insulation Lath

Fiber insulation lath shall be nailed securely to wood supports at intervals of not more than 4½ inches with blued or bright nails of the following sizes:

For ½-inch lath—1½-inch blued fiberboard nails or 4d box nails.

For 1-inch lath—1¾-inch blued fiberboard nails or 6d box nails.

End joints (except interlocking type) shall be approximately 3/16-inch to 1/4-inch. Ship-lapped, tongued-and-grooved, or interlocking edges shall be fitted to moderate contact.

1803.5—Metal Lath.

Metal lath shall be attached to vertical wood supports with not less than 4d common nails, driven to a penetration of at least $\frac{3}{4}$ -inch and bent over to engage not less than three strands of lath, or with 1-inch roofing nails with $\frac{7}{16}$ -inch diameter heads, or with 1-inch, No. 14 gauge wire staples.

Metal lath shall be attached to horizontal wood supports with not less than $1\frac{1}{2}$ -inch, No. 11 gauge, barbed bright roofing nails with $\frac{7}{16}$ -inch diameter heads, or with equivalent approved attachments.

Metal lath shall be attached to horizontal and vertical metal supports at not to exceed 6-inch intervals with not less than No. 18 W & M gauge, galvanized soft annealed tie wire, or approved metal clips or other approved attachments of equivalent strength.

Nails, staples, wire ties, or approved attachments for both vertical and horizontal supports shall be spaced not to exceed 6 inches on centers.

Wire lath shall be applied in the same manner as metal lath, and shall likewise be subject to all the other requirements of this Chapter covering metal lath.

1803.6—Angle and Joint Reinforcement

All internal vertical and horizontal angles of wood lath, fiber insulation lath, and gypsum lath, shall be continuously reinforced with metal lath cornerite not less than 6 inches wide, 3 inches on each surface. Cornerite shall be attached along its outer edges and such attachment shall be to the lath only; nails shall not extend through the lath into the supports.

SECTION 1804—PARTITIONS

1804.1—Studs and Anchorage

Studs for solid and hollow metal lath and plaster partitions shall be individually anchored, or shall be firmly attached to metal or wood runners, base or track which are suitably anchored to floor and ceiling construction. Spacing of channels or studs shall be governed by the type and weight of metal lath used, in accordance with the requirements of Table 1803.1.

SECTION 1805—CEILINGS

1805.1—Hangers and Attachments

The size of hangers for contact, furred, and suspended ceilings shall be not less than that required in Section 1805.2. Hangers shall be attached to structural supports as follows: For steel beams or joists, hangers or attachments shall be wrapped around, inserted through, or clipped or bolted to beams or joists; for concrete beams and slabs, hangers shall be placed before concrete is poured, and shall be looped and embedded at least 2 inches in the concrete.

For wood construction, hangers shall be inserted through holes drilled in the joists and the upper end of each hanger twisted three times around itself, or hangers may be attached to 30d nails driven into sides of joists at least 5" from bottom edges, and not over 36" on centers, and the upper end of each hanger twisted three times around itself.

Wire hangers for suspended ceilings shall be saddle tied to main runners and the end given three twists around main part of hanger. Rod hangers shall be of sufficient length to saddle tie to main runners or shall be wrapped around or securely wire tied to main runners. The lower ends of flat hangers shall be bolted to main runners with $\frac{3}{8}$ -inch diameter bolts or shall be bent tightly around main runners and bolted to the main part of the hanger. All hanger wire shall be galvanized.

1805.2—Hanger Wire Sizes

(a) Contact Ceilings: For rib metal lath attached directly to the under-side of concrete joists not less than 2 strands of No. 14 W & M gauge wire tied together shall be used; and for steel joists, not less than 2 strands of No. 16 W & M gauge wire tied together shall be used.

(b) Furred Ceilings: Cross furring, which supports an area of not over 8 square feet, shall be attached to the underside of both wood and steel joists with not less than 2 strands of No. 16 W & M. gauge wire, and to the under-side of concrete joists with not less than 2 strands of No. 14 W & M gauge wire tied together.

(c) Suspended Ceilings: Hangers, supporting not more than 16 square feet, shall be of No. 8 W & M gauge wire spaced not over 4 feet center to center.

1805.3—Main Runners

Main runners shall be cold or hot rolled steel channels, shall be painted with rust-inhibitive paint and shall be not less than the sizes and weights set forth in Table 1805.3.

TABLE 1805.3

Size and Spacing of Main Runners for Suspended Ceilings

Center to Center Spacing of Hangers	Main Runners		
	Size	Weight per 1000 Lbs.	Max. Spacing
Up to 2 Ft.	$\frac{3}{4}$ "	300 Lb.	3 Ft.
Up to 3 Ft.	1"	410 Lb.	4 Ft.
Up to 4 Ft.	1 $\frac{1}{2}$ "	475 Lb.	4 Ft.

1805.4—Cross Furring

Cross furring for various spacings of main runners or other supports shall be not less than as set forth in Table 1805.4. Cross fur-

ring shall be erected at right angles to supports and shall be securely saddle tied with not less than 2 strands of No. 16 W & M. gauge galvanized wire.

TABLE 1805.4

Size and Spacing of Cross Furring for Furred and Suspended Ceilings

Center to Center Spacing of Supports	Cross Furring	
	Size, Type and Weight	Maximum Spacing (Inches)
Up to 2 Ft.	¼" Pencil Rods	12
	⅜" Pencil Rods	19
Up to 3 Ft.	¼" Cold or Hot Rolled Channels @ 300 Lbs. per 1000 Ft.	24
Up to 4 Ft.		16

SECTION 1806—INTERIOR PLASTERING

1806.1 — GYPSUM NEAT PLASTERING

First coat on all types of lath shall be mixed in the proportions of 1 part gypsum neat plaster to not more than 2 parts of sand, by weight.

First coat on masonry surfaces (except monolithic concrete) and second (brown) coat in all three-coat work shall be mixed in the proportions of 1 part of gypsum neat plaster to not more than 3 parts of sand, by weight.

1806.2 — GYPSUM-VERMICULITE PLASTER

When vermiculite is used as an aggregate, the first coat on all types of lath shall be mixed in the proportions of 100 lbs. of gypsum neat plaster to not more than 2 cubic feet of vermiculite.

When vermiculite is used as an aggregate, the first coat on masonry surfaces (except monolithic concrete) and second (brown) coat in all three-coat work shall be mixed in the proportions of 100 lbs. of gypsum neat plaster to not more than 3 cubic feet of vermiculite.

1806.3 — GYPSUM READY-SANDED PLASTER

Gypsum ready-sanded plaster shall be used without the addition of aggregate. The first coat on all types of lath, scratch-coat gypsum ready-sanded plaster shall be used.

For application to masonry surface (except monolithic concrete) and for second (brown) coat in all three-coat work, either scratch coat or brown-coat gypsum ready-sanded plaster may be used.

1806.4 — GYPSUM WOOD-FIBER PLASTER

For two and three-coat work on all types of lath, gypsum wood-fiber plaster shall be used without the addition of aggregate.

For two and three-coat work on masonry surfaces (except monolithic concrete) gypsum wood-fiber plaster shall be mixed in the proportions of 1 part of plaster to 1 part of sand, by weight.

1806.5 — BOND PLASTER

For application on monolithic concrete, a specially prepared bond plaster shall be used with the addition of water only. Aggregate shall not be added.

1806.6 — THICKNESS

Grounds shall be installed so as to provide for the following thicknesses of plaster, from face of plaster base to finished plaster surfaces.

Thickness of Plaster	
Lath (Metal Lath, Wire Lath, and Wire Fabric)	5/8 In. Min.
All other types	1/2 In. Min.
Unit Masonry and Concrete Walls	5/8 In. Min.
Monolithic Concrete Ceilings	1/2 In. Min.
	3/4 In. Max.

1806.7 — GYPSUM CONSTRUCTION

Gypsum plaster only shall be used on gypsum construction.

SECTION 1807—EXTERIOR PLASTERING (STUCCO)

1807.1 — GENERAL

Exterior lathing shall be done in the manner and with the materials specified in this Section.

1807.2 — REINFORCEMENT REQUIRED

Stucco, except when applied directly to masonry or concrete, shall be reinforced with one of the metal plastering bases prescribed below:

Type of Reinforcement

Metal Lath	Flat Expanded or Self Furring	Minimum Weight
		3.4 Lbs. per Sq. Yd.
Expanded Metal	Openings not to Exceed 4 Sq. In.	1.8 Lbs. per Sq. Yd.
	Openings not to Exceed 4 Sq. In.	20 Lbs. per 100 Sq. Ft.
Wire Fabric		

1807.3 — Waterproof Building Paper or Felt

Waterproof Building Paper or Felt shall be used except in back-plastered constructions and shall weigh not less than 15 Lbs. per 100 Sq. Ft. and shall be free from holes or breaks. The paper shall meet the requirements of Federal Specifications UU-P-536.

1807.4 — Application of Metal Reinforcement

(a) Cover all wood surfaces to receive metal reinforcement, except areas to be back-plastered, with waterproof building paper or felt. Each strip shall lap the strip below and adjacent strips and flashing at least 3 in.

(b) If the surface to be stuccoed has no solid backing, the wood studs or supports shall have parallel strands of No. 18 W & M Gage annealed wire stretched tightly across their faces at 6-in. intervals to serve as a backing for the waterproof paper or felt.

(c) Metal reinforcement over vertical wood supports or sheathing shall be furred out not less than $\frac{1}{4}$ -inch by an approved furring nail. Nails for attaching the reinforcing shall be galvanized, shall penetrate the wood at least 1-inch, and shall be spaced not more than 6-inches on centers vertically and not more than 16-inches on centers horizontally; except that furring nails for attaching metal reinforcement to the underside of horizontal surfaces shall penetrate the wood not less than $1\frac{1}{2}$ inches.

1807.5 — Mortar for all Coats

The mixture shall be 1 volume of Portland cement to not less than 3 volumes or more than 5 volumes of damp, loose aggregate.

Hydrated lime may be added as a plasticizing agent but the amount used shall not exceed 10 percent by weight, or 25 percent by volume, of the amount of the Portland cement. If lime putty is added the amount shall not exceed 25 percent by volume of the Portland cement. When lime is added as a putty, Normal Finishing Hydrated Lime may be used when soaked for a period of not less than 16 hours. When lime is added as a dry hydrate it shall meet the requirements for Special Finishing Hydrated Lime.

1807.6 — Application and Curing

All Portland cement stucco work shall be composed of three coats totaling not less than $\frac{3}{8}$ " in thickness. The scratch and brown coats shall be approximately $\frac{3}{8}$ " each while the finish coat is to be of not less than $\frac{1}{8}$ " in thickness.

Before the scratch coat hardens it shall be evenly scratched to provide a good mechanical key for the second or brown coat.

The brown coat shall not be applied sooner than 48 hours after the application of the scratch coat, and the finish coat shall not be applied sooner than 7 days after the application of the brown coat.

Each coat of stucco shall be kept damp for at least 48 hours after application, and before applying each successive coat the surface of the preceding coat shall be dampened evenly to obtain uniform suc-

CHAPTER XIX

RAT-PROOF CONSTRUCTION

SECTION 1900—RAT-PROOFING

This Chapter provides regulations governing the rat proofing of occupancies that provide conditions favorable to rodent infestation and propagation.

SECTION 1901—OCCUPANCY

Every building in which feed, foodstuff or food is stored, prepared processed, served or sold, shall be made, maintained or built of rat proof construction by the owner, tenant, or occupant in accordance with the provisions of this section. This Chapter applies particularly to the following occupancies:

Group B—Cafes or Restaurants

(Curb Markets (see Section 1902.3)

Group E—Large Restaurants

Group F—Storage

Group G—Slaughter Houses

1901.1 — EXISTING OR NEW BUILDINGS

(a) **Foundation Wall Ventilation Openings**—All foundation wall ventilator openings shall be covered for their entire height and width with perforated sheet metal plates of a thickness not less than fourteen (14) U. S. Standard Gauge or with expanded sheet metal of a thickness not less than eighteen (18) U. S. Standard Gauge or with cast iron grills or gratings, or with hardware cloth of nineteen (19) B. & S. Gauge or heavier. The openings therein shall not exceed one-half ($\frac{1}{2}$) inch.

(b) **Miscellaneous Foundation and Exterior Wall Openings**—All foundation and exterior wall openings (except those used for doors and screened windows), such as those openings around pipes, electric cables, conduits, openings due to deteriorated walls, broken masonry or concrete, shall be protected against the passage of rats by closing such openings with cement mortar, concrete masonry or non-corrodible metal.

(c) **Doors**—All exposed edges of the lower ten inches of wooden doors, door sills and jambs serving as rear or side entrances into business buildings from the ground, basement, or cellar floors and other doors accessible to rats shall be protected against gnawing by covering doors, door sills and jambs with solid sheet metal of not less than twenty-four (24) U. S. Standard Gauge thickness.

All doors on which metal protection has been applied shall be hinged so as to be free swinging. When closed, doors shall fit snugly so that the maximum clearance between any door, door jambs and sills shall not be greater than three-eighths ($\frac{3}{8}$) inches.

Door jambs and sills constructed of metal, concrete, masonry, stone or cement mortar will be acceptable without metal protection as specified under paragraphs above.

(d) **Windows**—All windows and other openings for the purpose of light or ventilation located in exterior walls within two (2) feet above the existing ground level immediately below such opening shall be covered for their entire height and width, including frame, with wire cloth of at least nineteen (19) B. & S. Gauge having a mesh not larger than one-half ($\frac{1}{2}$) inch.

All windows and other openings for the purpose of light and ventilation in the exterior walls not covered in paragraph above, accessible to rats by way of exposed pipes, wires, conduits, and other appurtenances shall be covered with wire cloth of at least nineteen (19) B. & S. Gauge or heavier having a mesh not larger than one-half ($\frac{1}{2}$) inch or in lieu of wire cloth covering, said pipes, wires, conduits and other appurtenances shall be blocked from rat usage by installing solid sheet metal guards of twenty-four (24) U. S. Standard Gauge or heavier. Guards shall be fitted snugly around pipes, wires, conduit or other appurtenances. In addition, they shall be fastened securely to and shall extend perpendicularly from the exterior wall for a minimum distance of twelve (12) inches beyond and on either side of pipe, wire, conduit or appurtenance.

SECTION 1902—CONSTRUCTION

1902.1 — MASONRY CONSTRUCTION AND CONCRETE FLOORS

All new buildings with concrete floors shall be constructed with no intervening space between the edge of the floor slab and building walls. All openings in the floor slab shall be properly protected against the passage of rats.

1902.2 — PIER AND WOOD CONSTRUCTION

(a) **Less Than Twelve Inches Above Ground**—All new buildings constructed on piers having wooden floor sills less than twelve (12) inches above the surface of the ground shall have the intervening space between floor sills and ground protected against the passage of rats by installing a solid masonry, concrete curtain wall around the entire perimeter of the building and extending said curtain wall to a depth of not less than twenty-four (24) inches below the surface of the ground level and fastening securely to the exterior wall of the building.

Where curtain walls are not desirable, all ground floors of wood construction may be replaced with concrete of not less than four (4) inches in thickness with the exterior walls protected for a height of twenty-four (24) inches above the concrete floor with masonry, concrete or solid sheet metal of twenty-four (24) U. S. Standard Gauge or heavier. Exterior wall protection shall be securely tied into the concrete floor at all points.

(b) **Over Twelve Inches Above Ground**—Buildings constructed on piers having wooden floor sills more than twelve (12) inches above the ground level, shall have the intervening spaces between floor sills and ground protected against the passage of rats by installing curtain walls in accordance with Section 1902.2 (a), or protecting said building against the passage of rats by installing solid sheet metal collars of twenty-four (24) U. S. Standard Gauge or heavier at top of each pier and snugly around each pipe, cable, wire, conduit or other utility service passing through wooden ground floor. Metal collars shall be not less than eight (8") inches greater in diameter than the pier, pipe, cable, wire, conduit or other utility service and shall be securely fastened underneath the wooden floor. All other openings in wooden ground floors through which rats may gain entrance into double walls or the interior of business buildings, such as openings that may exist in floors at double walls above floor sills, shall be closed with twenty-four (24) U. S. Standard Gauge or heavier solid sheet metal or sixteen (16) B. & S. Gauge or heavier wire cloth of one-half ($\frac{1}{2}$) inch mesh or with concrete or masonry.

1902.3 — CURB OR FARMER'S MARKET

The floors of Curb or Farmer's Markets in which fruit or vegetables are exposed and offered for sale shall be paved with four inches of concrete for the entire surface area of the market. The floor shall be protected by a curtain wall of concrete or masonry of not less than four (4) inches in thickness, hermetically sealed to the surface pavement, and extending not less than twenty-four inches below the ground surface. Curtain wall shall be extended around the entire perimeter of the floor pavement. Display racks, stands, or platforms on which fruit or vegetables are stored or offered for sale shall be of sufficient height that all such fruit or vegetables shall be kept at a distance of not less than eighteen (18) inches above the floor pavement and so constructed that rats cannot harbor in or under such racks.

CHAPTER XX

LIGHT, VENTILATION AND SANITATION

SECTION 2001—LIGHT AND VENTILATION

2001.1 — MINIMUM REQUIREMENTS

Every habitable room of buildings hereafter erected shall have one or more windows, unless otherwise, specifically provided herein, to afford adequate light and ventilation. The requirements specified in this chapter shall be considered as minimum requirements supplementary to all State laws regulating light and ventilation.

Where windows are required such windows shall open on a street, public space, yard, or approved open space that will afford adequate air and light. Required windows shall be so constructed that when fully opened, the total open space shall not be less than one-half ($\frac{1}{2}$) the window area.

Skylights, vents, louvers or mechanical ventilation may be substituted for windows when approved by the Building Official, provided adequate natural light and ventilation is provided to meet the requirements of this chapter.

Except as otherwise provided herein, required windows shall have glazed openings of clear glass of area not less than one-tenth ($\frac{1}{10}$) of the floor area of the room served by them with the following exceptions:

Basements and cellars not used for habitational purposes—windows shall have an area not less than one-fiftieth ($\frac{1}{50}$) of the floor area served.

Storage rooms—windows shall have an area not less than one-twentieth ($\frac{1}{20}$) of the floor area served.

Obscure glass, glass blocks and similar glazed panels that admit less light than clear glass shall have area increased to admit amount of light equivalent to the above requirement.

Rooms where by reason of use or occupancy, dust, fumes, gases, vapors, odors or other hazardous, obnoxious, or injurious impurities exist shall be provided with adequate additional ventilation to insure safe and healthful conditions.

2001.2 — ALCOVES

An alcove opening off a habitable room may be included as part of that room in determining the window area required provided eighty percent (80%) or more of the common wall area provides an unobstructed opening to the alcove.

2001.3 — BASEMENT ROOMS

No room that has less than fifty per cent (50%) of its height above the average adjoining finished grade shall be used for a Residential occupancy.

2001.4 — TOILETS

Toilet rooms shall not open directly into kitchens or rooms used for the preparation of food.

Every toilet room shall have windows as specified for habitable rooms providing in no case less than three (3) Sq. Ft. of open space, or shall have approved, equivalent mechanical ventilation.

2001.5 — CLASSROOMS

Classrooms in School occupancies shall have at least unilateral light. The windows shall be located on the long axis of the room and the tops of windows shall be not more than six (6) inches below the ceiling.

2001.6 — MECHANICAL VENTILATION

Where ventilation is provided by mechanical means, fresh air in sufficient quantity to maintain healthful conditions shall be provided to meet the requirements of all State laws. In the absence of such requirements, ventilation at least equivalent to the requirements of this code governing natural ventilation shall be provided.

Lavatories, toilets, bathrooms, and rest rooms shall be provided with at least two (2) cubic feet of fresh air per minute per square foot of floor area.

SECTION 2002—SANITATION

2002.1 — TOILET FACILITIES

Toilet facilities shall be provided in all occupancies for each sex, according to Table 2002.2 except one family living units. The number provided for each sex shall be based on the maximum number of persons of that sex that may be expected to use such building at any one time. Where negroes and whites are accommodated there shall be separate toilet facilities provided for the former, marked plainly "For Negroes Only."

(See Plumbing Code for regulations governing installation and facilities. Also see Appendix D, for recommended practice on minimum number of closets.)

CHAPTER XXI

SAFEGUARDS DURING CONSTRUCTION

SECTION 2101—GENERAL

The temporary use of streets or public property for the storage or handling of materials or of equipment required for construction or demolition, and the protection provided to the public shall be in accordance with the provisions of this chapter.

2101.1—ALLOWABLE USE OF PUBLIC PROPERTY DURING CONSTRUCTION

The amount of space and conditions under which public property may be used for construction or demolition purposes shall be as set forth below:

- (a) One-third ($1/3$) of the width of street that is adjacent to the curb in front of the building being erected and for which a permit has been issued. If street in front of property adjoining such building is to be used for similarly limited storage, a due waiver of claim against the city for damages on account of such use, issued by the owner of such property, must be filed with the Building Official before such use shall be allowed.
- (b) Provisions under which street or sidewalk space may be used:
 1. That such one-third ($1/3$) allocated space or any portion thereof shall not come within five (5) feet of a rail or railway track.
 2. That a walkway be constructed in the outer portion of the permissible occupied street space, conforming to the requirements of Section 2101.3.
 3. That no building material, fence, shed or any obstruction of any kind shall be placed so as to obstruct free approach to any fire hydrant, lamp post, manhole, fire alarm box, or catch basin, or so as to interfere with the passage of water in the gutter. Protection against damage shall be provided to such utility fixtures during the progress of the work, but sight of them shall not be obstructed.
 4. That a ten (10) foot clear roadway be maintained through any alley located along the building site.
 5. That proper precaution shall be made during construction to prevent concrete, mortar washings, or any other material from entering a sewer.

2101.2 — WHERE COVERED WALKWAYS ARE REQUIRED

During the erection or demolition of any building exceeding one (1) story in height that is located at a distance less than ten (10) feet or less than one-quarter ($\frac{1}{4}$) of the height of the building from any street or alley property line, or when required by the Building Official... a roof covering for the entire length of the project shall be provided over the temporary or permanent sidewalk, from the time the construction or demolition extends above the second floor level until materials are no longer being used or handled on the front above such walk.

Buildings having their exteriors altered or repaired in an extensive manner involving any hazard shall be provided with a covered walk as required for new structures during erection.

Exception:

Where, in the opinion of the Building Official, a covered walk is not necessary, a permit may be issued to block off part of the sidewalk and have a temporary walk constructed as provided in Section 2101.3.

2101.3 — CONSTRUCTION OF WALKWAYS FENCES AND PROTECTIVE COVERING

Before any construction work is commenced the owner or his agent shall construct a temporary walkway in conformity with this section.

- (a) All fences, barriers, or temporary structures of any kind located on public highways, shall be so constructed as not to obstruct vision at the intersection of streets.
- (b) Walkways shall be not less than four (4) feet wide in the clear except that in congested districts the Building Official may require a walkway as wide as, in his opinion, is necessary. Walks shall be built in safe and substantial manner and be maintained in that condition at all times. A smooth handrail of substantial construction, not less than three (3) feet high, shall be provided on the traffic or street side of the walkway, and also on the building side when considered necessary by the Building Official.
- (c) Where the distance from building to street or alley property line is less than half the height of the building, a fence of substantial solid construction at least eight (8) feet high shall be provided on the building side of the walkway.
- (d) Roof coverings over walkways, as required by Section 2101.2, shall be constructed of not less than one layer of two (2) inch nominal dimension wood plank spanning not over three (3) feet between supports, or equivalent decking. The framework supporting the walkway covering shall be well braced and designed to support at least one hundred fifty (150) Lbs. per Sq. Ft. but the top deck shall be designed to carry not

less than two hundred fifty (250) Lbs. per Sq. Ft. The roof covering shall be of width sufficient to cover the entire walkway or sidewalk, and shall be made watertight. Suitable provision shall be made for adequate lighting of the walk under the covering, at all times. A minimum clearance of eight foot six inches (8'-6") shall be maintained above walkways.

2101.4 — WALKWAYS OVER EXCAVATED AREAS

When the area occupied by the sidewalk or temporary walkway is to be excavated, such walk shall be made of boards not less than two (2) inches nominal dimension designed to support a load of not less than one hundred and fifty (150) pounds per Sq. Ft., provided with suitable ramps at each end. Such walkways shall be provided with a fence and handrails on each side.

2101.5 — STORAGE OF MATERIALS OVER WALKWAYS

Whenever roofs of walkways are used for the storing of materials, it shall be designed for the load to which it is to be subjected and a railing and footboard shall be installed so as to prevent the materials from spilling into the street. The posts and/or other supporting members on the street side shall be protected so as to insure against failure due to impact from street traffic.

2101.6 — WALKWAYS TO BE KEPT IN REPAIR

The street side of any barricade or fence, handrails and sidewalks shall be kept reasonable smooth and in good repair while construction work is in progress, or while such barricades, fences, or walkways are placed on or over public property.

2101.7 — CLEANING OF SIDEWALKS AND STREETS

The owner or his agent, upon the completion of the building, shall immediately remove all walkways, debris or any other obstructions and leave such public property in as good a condition as it was before such work was commenced.

2101.8 — RED LIGHTS REQUIRED

Every walkway shall be kept well lighted continuously between sunset and sunrise and the outer edge of the occupied space of the street or sidewalk shall have placed thereon "red lights" which shall burn continuously between sunset and sunrise.

2101.9 — SAFETY REQUIREMENTS DURING CONSTRUCTION

- (a) Scaffolds—All scaffolds shall be substantially constructed to insure the safety of persons working on them or passing under or near them. Planks used for platforms shall be of not less than two (2) inch nominal thickness of sound, seasoned lumber or equivalent. Clear span between scaffolding supports shall not exceed ten (10) feet.

Where a large amount of scaffolding is used, the Building Official may require use of non-combustible material or lumber treated to make it fire resistive. The flameproofing of tarpaulins may also be required by the Building Official where, in his opinion, the fire hazard warrants such precaution.

- (b) Hoists—Temporary construction hoists shall be substantially constructed and protected to insure safe operation. Floor openings and other spaces through which they operate shall be enclosed on all sides for the full height, except for the necessary doors for loading and unloading, with barriers so constructed to prevent heads, arms, or legs from being thrust into the hoistway, or loose material from falling through them.

No hoist shall be used for transportation of persons unless it is equipped for passenger service as required by this code.

2101.10 — PROTECTION OF ROOFS AND SKYLIGHTS OF ADJOINING BUILDINGS

When a building or structure is to be carried above the roof of an adjoining building, protection for the skylights and roof of such adjoining building shall be provided, at his own expense, by the person constructing or causing the construction of such building or structure; provided that if the owner, lessee or tenant of the adjoining building should refuse permission to have the roofs and skylights protected, the responsibility and expense for the necessary protection shall devolve on the person refusing such permission.

CHAPTER XXII

USE OF PUBLIC PROPERTY

SECTION 2201—GENERAL

The use of public property or any portion thereof, shall be in accordance with the provisions of this chapter, except signs which shall conform to the requirements of Chapter XXIII, Signs and Outdoor Displays, and allowable use of public property during construction, Section 2101.1.

DOORS AND WINDOWS

No door in the city limits shall open or project upon public property. Exit doors, as specified in Section 1110, Doorways, which are required to open in the direction of exit travel, shall be set back from the property line by means of vestibules or similar enclosures. Windows which swing over public property shall have a clearance of not less than eight feet above the sidewalk or ground level.

2201.2 — MARQUEES OR FIXED AWNINGS

- (a) Fixed awnings or marquees shall be entirely supported from the building.
- (b) All combustible materials used in the construction of such awnings or marquees, shall be protected with not less than one hour fire resistive protection as specified in Chapter X. All glazing in marquees or fixed awnings shall be of wired glass.
- (c) Every fixed awning or marquee shall be at least ten feet in the clear, between the lowest point or projection and a sidewalk immediately below. (See 2303.5—Marquee Signs.)
- (d) No fixed awning or marquee shall extend or occupy more than two-thirds ($2/3$) of the width of sidewalk measured from the building, except that such fixed awning or marquee may occupy the entire width of the sidewalk, provided it is twelve feet in the clear above the sidewalk and does not extend more than twenty-five (25) feet along the direction of the length of the street. The overall height of any marquee, including signs, shall not exceed eight (8) feet, measured from the roof of such marquee.

2201.3 — MOVABLE AWNINGS (Metal or Canvas)

Metal or canvas awnings may extend over public property for a distance of not more than five (5) feet, provided such awnings or any part thereof maintain a clear height of eight (8) feet above the sidewalk.

All such movable awnings shall be supported on metal frames attached to the building.

2201.4 — PROHIBITIVE LOCATIONS

(a) Every awning or marquee shall be so located as not to interfere with the operation of any exterior standpipe, stairway or exit from the building.

(b) Awnings or marquees shall not be used as a landing for any fire escape or exterior stair.

2201.5 — CONSTRUCTION REQUIREMENTS

Marquees and awnings shall be so constructed and anchored to the building so as to support all live and dead loads as specified in Chapter XII.

2201.6 — ROOF DRAINAGE REQUIRED

The roof of every fixed awning or marquee shall be sloped to down spouts at the building, which shall conduct all drainage under the sidewalk to the curb.

SECTION 2202—OTHER PROJECTIONS

2202.1 — GENERAL

Every projection of any character over or upon public property shall maintain a clear height above the sidewalk or ground level of not less than eight feet. The allowable projection over public property shall not exceed the following measurements from the building.

Bay windows, porches, balconies, fire escapes—three (3) feet.

Cornices, Belt Courses, sills, pilasters, water tables or any decorative features—six (6) inches.

See Section 710 for fire protective requirements.

2202.2 — SIDEWALK OR STREET OBSTRUCTIONS

Public property shall be maintained clear of any and all obstructions, including among others, posts, columns, display of wares or merchandise and sidewalk signs.

SECTION 2203—SPACE UNDER PUBLIC PROPERTY

2203.1 — SPACE UNDER SIDEWALK

Where space under the sidewalk is used for any purpose a special permit shall be required from the city governing authorities.

2203.2 — SIDEWALK LIGHTS

When glass is set in the sidewalk to provide light for spaces underneath, the glass shall be supported by metal or reinforced concrete frames and such glass shall be not less than one-half ($\frac{1}{2}$) inch in thickness. When such glass is over twelve (12) square inches in area, it shall have wire mesh embedded in the glass. All portions of sidewalk lights shall be of not less strength than required in Section 2203.3 for sidewalks.

SECTION 2204—MOVING OF BUILDINGS

2204.1 — GENERAL

No building or part of any building shall be moved through or across any sidewalk, street, alley or highway within the City limits without first obtaining a permit from the Building Department.

2204.2 — WRITTEN APPLICATION MUST BE FILED

Any person desiring to move a building shall first file with the Building Department a written application setting forth the following information.

- (a) Type and kind of building to be moved.
- (b) The original cost of such building.
- (c) The extreme dimensions of the length, height and width of the building.
- (d) Its present location and proposed new location by lot, block, subdivision and street numbers.
- (e) The approximate time such building will be upon the streets, and the contemplated route that will be taken from present to new location.

2204.3 — BUILDING OFFICIAL SHALL REJECT WHEN

If in the opinion of the Building Official, the moving of any building will cause serious injury to persons or property or serious injury to the streets or other public improvements, or the building to be moved has deteriorated more than fifty per cent of its original value by fire or other element, or the moving of the building will violate any of the requirements of this Code or of the Zoning Regulations of the City, the permit shall not be issued and the building shall not be moved over the streets of the City.

Any building being moved for which permit was granted shall not be allowed to remain in or on the streets of the City for more than forty-eight hours.

2204.4 — BOND REQUIRED

The Building Official, as a condition precedent to the issuance of such permit, shall require a bond to be executed by person desiring such removal permit, with corporate surety to his satisfaction. Such bond shall be made payable to city and for such amount as he prescribes. It shall indemnify the City against any damage caused by the moving of such building to streets, curbs, sidewalks, shade trees, highways and any other property which may be affected by the moving of a building. Such surety bond shall also be conditioned upon and liable for strict compliance with the terms of said permit, as to route to be taken and limit of time in which to effect such removal and to repair or compensate for the repair and to pay said City as liquidated damages an amount not exceeding fifty dollars (\$50.00) to be prescribed by the Building Official for each and every day's delay in completing such removal or in repairing any damage to property or public improvement or in clearing all public streets, alleys or highways of all debris occasioned thereby.

2204.5 — NOTICES TO BE GIVEN BY BUILDING DEPARTMENT

Upon the issuance of said moving permit, the Building Official shall cause notice to be given to the Superintendent of Fire Alarm, Chief of Fire Department, telephone or light companies, or others whose property may be affected by such removal. The Building Department shall set forth in all notices the route that will be taken, time, started, and approximate time of completion.

2204.6 — PUBLIC SAFETY REQUIREMENTS

(a) Lights required

Every building which occupies any portion of public property after sundown, shall have sufficient lights continuously burning between sunset and sunrise for the protection of the public.

(b) Number and location

There shall be a minimum of five red lights placed on each street side of the building; such red lights shall be attached to the building in such a fashion as to indicate extreme width, height, and size.

(c) Flares required

There shall be placed in addition to the red lights on the building, flares at regular intervals for a distance of two hundred feet up the street on each side of the building.

(d) Flagmen required

When more than fifty per cent of the street, measured between curbs, is occupied at night by the building, or when in the opinion of the Building Official, flagmen are necessary to divert or caution traffic, the owner or person moving such building shall employ at their expense, two flagmen, one at each street intersection beyond the building; such flagmen shall remain at these intersections, diverting or cautioning traffic from sunset to sunrise. Red lights shall be employed in flagging traffic at night.

CHAPTER XXIII

SIGNS AND OUTDOOR DISPLAYS

SECTION 2301—GENERAL

2301.1 — OUTDOOR ADVERTISING DISPLAYS

Outdoor advertising displays, means any letter, figure, character, mark, plane, point, marquee sign, design, poster, pictorial, picture, stroke, stripe, line, trademark, reading matter or illuminated service, which shall be so constructed, placed, attached, painted, erected, fastened or manufactured in any manner whatsoever, so that the same shall be used for the attraction of the public to any place, subject, person, firm, corporation, public performance, article, machine or merchandise, whatsoever, which are displayed in any manner whatsoever out of doors. Every outdoor display shall be classified and conform to the requirements of that classification as set forth in this chapter.

2301.2 — CLASSIFICATIONS

For the purpose of this chapter and the regulations and provisions thereof, outdoor advertising displays shall be classified into one of following type signs:

(a) **Spectacular Signs**—means an "Outdoor Advertising Display Sign" advertising copy usually animated, constructed of metal, wired for lights or luminous tubing, or both, with copy action controlled by the flasher circuit breakers or matographs and attached on an open face steel structure built especially for the purpose.

Spectacular signs may be built upon the ground, attached to a wall, or above the roof, or projecting from a wall, provided that such spectacular sign meets the requirements of the provisions of this code governing set-ups of ground, roofs or walls, depending upon where such sign is built, as set forth below.

Spectacular signs shall be illuminated with electricity only.

(b) **Ground Sign**—means an "Outdoor Advertising Display Sign" when such sign is supported by uprights or braces in or upon the ground.

(c) **Roof Sign**—means an "Outdoor Advertising Display Sign" erected, constructed, or maintained above the roof of any building.

(d) **Wall Sign**—means an "Outdoor Advertising Display Sign" that shall be affixed to the wall of any building, when such sign shall project not more than twelve (12) inches from the building.

(e) **Projection Sign**—means an "Outdoor Advertising Display Sign" which is affixed to any building wall or structure and extends beyond the building wall, structure, building line or property line more than twelve (12) inches.

(f) **Marquee Sign**—means a projecting sign attached to or hung from a marquee and said marquee shall be known to mean a canopy or covered structure projecting from and supported by a building, when such canopy or covered structure extends beyond the building, building line or property line.

(g) **Shingle Sign**—means a projection or wall sign not over six (6) square feet in area, constructed of metal or other non-combustible material attached securely to a building and not projecting more than twenty-four (24) inches over public property.

2301.3 — PERMITS REQUIRED

(a) No 'Outdoor Advertising Display Sign' shall hereafter be erected, constructed, altered or maintained except as provided in this code, until after permit for the same has been issued by the Building Official as specified in Sections 105 and 106 and the fee paid as specified in Section 107, Fees.

2301.3 (b) Exemption

No permit fee shall be required for a shingle sign over a show window or door of a store or business establishment, announcing without display or elaboration, only the name of the proprietor and nature of the business; nor shall a permit be required for a ground sign advertising for sale or rent property, providing such sign is not over fifteen (15) square feet in area.

2301.4 — IDENTIFICATION OF SIGNS

Every Outdoor Advertising Display Sign hereafter erected, constructed or maintained, for which a permit is required shall be plainly marked with the name of the person, firm or corporation erecting and maintaining such sign and shall have affixed on the front thereof the number of permit issued for said sign by the Building Official.

2301.5 — ANNUAL INSPECTION

It shall be the duty of the Building Official or his authorized agent to inspect every ground sign, roof sign, wall sign, and projection sign at least once annually.

2301.6 — UNSAFE SIGNS

Should any sign become insecure or in danger of falling or otherwise unsafe in the opinion of the Building Official, the owner thereof, or the person or firm maintaining the same, shall upon written notice from the Building Official, forthwith in the case of immediate danger and in any case within ten (10) days, secure the same in a manner to be approved by the Building Official, in conformity with the provisions of this code or remove such sign. If such order is not complied with in ten (10) days the Building Official shall remove such sign at the expense of the owner or lessee thereof.

2301.7 — MAINTENANCE

All signs for which a permit is required, together with all their supports, braces, guys and anchors shall be kept in repair and unless of galvanized or non-corroding metal shall be thoroughly painted at least once every two years. The Building Official may order the removal of any sign that is not maintained in accordance with the provisions of this section. Such removal shall be at the expense of the owner or lessee.

2301.8 — UNLAWFUL SIGNS

In case any sign shall be installed, erected, or constructed in violation of any of the terms of this code the Building Official shall notify by registered mail or written notice served personally, the owner or lessee thereof to alter such sign so as to comply with this code or of the Zoning Regulations of the City and to secure the necessary permit therefor, or to remove the sign. If such order is not complied with in ten (10) days the Building Official shall remove such sign at the expense of the owner or lessee thereof.

2301.9 — LOCATION RESTRICTIONS

No Outdoor Advertising Display Sign shall be erected, constructed or maintained so as to obstruct any fire escape or any window or door or opening used as a means of egress or so as to prevent free passage from one part of a roof to any other part thereof. No sign shall be attached in any form, shape or manner to a fire escape, nor be placed in such manner as to interfere with any opening required for legal ventilation.

2301.10 — SIGNS PROJECTING OVER PUBLIC PROPERTY

Signs projecting from a building or extending over public property shall maintain a clear height of ten (10) feet above the sidewalk and all such signs shall not extend more than two thirds the width of the sidewalk measured from the building line.

SECTION 2302—STRUCTURAL REQUIREMENTS

2302.1 — DESIGN AND STRESS DIAGRAMS REQUIRED

Before a permit shall be granted the erector of every Outdoor Advertising Sign with the exception of shingle signs and light cloth temporary signs, shall submit to the Building Official a design and stress diagram or plan, containing the necessary information to enable the Building Official to determine that such sign complies with all the regulations of this code.

2302.2 — WIND PRESSURE

In the design and erection of all Outdoor Advertising Display Signs, the effect of wind shall be carefully considered. All signs shall be so constructed as to withstand the wind pressure as specified in Section 1205.

2302.3 — WORKING STRESSES

(a) In all Outdoor Advertising Display Signs, the allowable working stresses shall conform with the requirements of Section 1205 of this code, except as specified below.

The allowable working stresses for steel and wood shall be in accordance with the provisions of Chapter XV—"Structural Steel" and Chapter XVII—"Wood."

(b) The working strength of chains, cables, guys or steel rods shall not exceed one-fifth (1/5) of the ultimate strength of such chains, cables, guys or steel rods.

SECTION 2303—CONSTRUCTION

2303.1 — GROUND SIGNS

(a) No ground sign board constructed entirely of wood material shall be at any point over twenty-four (24) feet above the ground level or located in Fire District Number 1 or 2, but when the facing of a ground sign is constructed entirely of sheet metal or other non-combustible material such ground sign may be erected within or without the fire districts and the supports, braces, battens, ornamental moulding, platform and decorative trim may be of wood material.

(b) No ground sign shall be erected to a height exceeding thirty (30) feet above the ground or street level. Lighting reflectors may project beyond the face of the sign.

(c) The bottom coping of every ground sign shall be at least three (3) feet above the ground or street level, which space may be filled with platform decorative trim of light wooden construction.

(d) Every ground sign shall provide rigid construction to withstand wind action in all directions.

(e) Any person or persons, partnership, firm or corporation occupying any vacant lot or premises by means of a ground sign, shall be subject to the same duties and responsibilities as the owner of the lot or premises, with respect to keeping the same clean, sanitary, inoffensive, free and clear of all obnoxious substances and unsightly conditions on the ground in the vicinity of such ground sign on said premises for which they may be responsible.

2303.2 — ROOF SIGNS

(a) All roof signs shall be so constructed as to leave a clear space of not less than six (6) feet between the roof level and the lowest part of the sign and shall have at least five (5) feet clearance between the vertical supports thereof; no portion of any roof sign structure shall project beyond an exterior wall.

(b) Every roof sign shall be constructed entirely of steel construction, including the upright supports and braces, except that only the ornamental moulding and battens behind the steel facing and the decorative lattice work may be of wooden construction.

(c) The bearing plates of all roof signs, shall distribute the load directly to or upon masonry walls, steel roof girders, columns or beams. The building shall be designed to avoid overstress of these members.

(d) No roof sign having a tight or solid surface shall be at any point over twenty-four (24) feet above the roof level.

Open roof signs in which the uniform open area is not less than forty (40) per cent of total gross area may be erected to a height of seventy-five (75) feet on buildings of Type I or Type II Construction and on other type buildings to a height of forty (40) feet, all such signs shall be thoroughly secured to the building upon which they are installed, erected or constructed by iron, metal anchors, bolts, supports, chains, stranded cables, steel rods or braces and they shall be maintained in good condition as set forth in Section 2301.7.

2303.3 — WALL SIGNS

(a) Wall signs attached to exterior walls of solid masonry, concrete or stone, shall be safely and securely attached to the same by means of metal anchors, bolts or expansion screws of not less than three-eighths ($\frac{3}{8}$) inch in diameter and shall be embedded at least five (5) inches. No wooden blocks shall be used for anchorage, except in the case of wall signs attached to buildings with walls of wood. No wall sign shall be supported by anchorages secured to an unbraced parapet wall.

(b) The surface face of all wall bulletins must be of sheet metal but the ornamental moulding surrounding same may be of wooden construction. Temporary cloth signs with wood frames may be kept in place for a period not exceeding thirty (30) days.

2303.4 — PROJECTING SIGNS

(a) All projecting signs shall be constructed entirely of metal or other non-combustible material and securely attached to a building or structure by metal supports such as bolts, anchors, supports, chains, guys or steel rods. No staples or nails shall be used to secure any projecting sign to any building or structure.

(b) The dead load of projecting signs, not parallel to the building or structure and the load due to wind pressure shall be supported with chains, guys, or steel rods having net cross sectional dimension of not less than three-eighth ($\frac{3}{8}$) inch in diameter. Such supports shall be erected or maintained at angle of at least 45 degrees with the horizontal to resist the dead load and at an angle of 45 degrees or more with the face of the sign to resist the specified wind pressure. If such projecting sign exceeds thirty (30) square feet in one facial area, there shall be provided at least two such supports on each side not more than eight feet apart to resist the wind pressure.

(c) **Anchorage**—All supports shall be secured to a bolt or expansion screw that will develop the strength of the supporting chain, guys or steel rod, with a minimum five-eighths ($\frac{5}{8}$) inch bolt or lag screw, by an expansion shield. Turn buckles shall be placed in all chains, guys or steel rods supporting projecting signs.

(d) Chains, cables, guys, or steel rods used to support the live or dead load of projecting signs may be fastened to solid masonry walls with expansion bolts or by machine screws in iron supports, but no such supports shall be attached to an unbraced parapet wall. Where the supports must be fastened to walls made of wood, the supporting anchor bolts must go through the wall and be plated or fastened on the inside in a secure manner.

(e) No projecting sign shall be erected on the wall of any building so as to project above the roof or cornice wall or above the roof level where there is no cornice wall; except that a sign erected at a right angle to the building, the horizontal width of which sign perpendicular to such wall does not exceed eighteen (18) inches may be erected to a height not exceeding two (2) feet above the roof or cornice wall or above the roof level where there is no cornice wall. A sign attached to a corner of a building and parallel to the vertical line of such corner, shall be deemed to be erected at a right angle to the building wall.

2303.5 — MARQUEE SIGNS

Marquee signs shall be constructed entirely of metal or non-combustible material and may be attached to, or hung from a marquee, and such signs when hung from a marquee shall be at least eight (8) feet at its lowest level above the sidewalk or ground level, and further, no such sign shall extend outside the line of such marquee. Marquee signs may be attached to the sides and front of a marquee, and such sign may extend the entire length and width of said marquee, provided such sign does not extend more than six (6) feet above, nor one (1) foot below such marquee, but under no circumstances, shall the sign or signs have a vertical dimension greater than eight (8) feet.

2303.6 — SPECTACULAR SIGNS

All permits for spectacular signs shall be issued by the Building Official upon application therefor, after approval by the department having jurisdiction over electricity, upon payment of the required permit fee. The permit to erect or maintain a spectacular sign shall be good for one (1) year. The Building Official may issue a renewal of the permit issued hereunder upon the expiration thereof or within thirty (30) days thereafter upon the payment by the applicant of a renewal fee of two dollars (\$2.00) and by surrendering the old permit, accompanied by satisfactory proof in the form of an affidavit that the sign is as safe as when originally licensed and that the wiring or piping of the same is in good condition. All spectacular signs shall be constructed of non-combustible materials.

Section 2304—USE OF PLASTIC MATERIALS

Letters, decorations and facings of signs constructed of non-combustible materials may be made from slow-burning plastics, provided that when plastic facings are employed in electric signs, the area of each face shall not exceed 100 square feet, and provided that when plastic letters and/or decorations are employed in electric signs the area of the display surface or facing occupied or covered by such letters and decorations shall not exceed a total area calculated on the following basis:

Area of the Display Surface	Area Occupied or Covered by Plastics
Less than 100 square feet	100% of display surface area
Over 100 square feet but less than 300 square feet	100 square feet plus 25% of the difference between 100 square feet and the area of the display surface.
Over 300 square feet but less than 2000 square feet	150 square feet plus 25% of the difference between 300 square feet and the area of the display surface.

CHAPTER XXIV ELEVATORS AND ESCALATORS

2401.1

Elevators, escalators and dumbwaiters shall be constructed, installed and maintained to provide proper safety in accordance with the requirements of this Code. Construction of elevators, escalators and dumbwaiters shall conform with the "American Standard Safety Code for Elevators, Dumbwaiters and Escalators" (ASA-A17.1) of the American Standards Association.

2401.2

(a) All openings in elevator shafts shall be protected. Elevators and escalators shall be enclosed as required in Section 701.

(b) The safe capacity of every elevator shall be conspicuously posted.

(c) Every elevator and escalator shall be equipped with approved safety devices to prevent injury to its occupants from excessive speed. There shall be approved safety devices to prevent an elevator from being moved while any shaft door is open.

(d) Every passenger elevator shall have an emergency exit.

(e) Elevators and escalators may be used as required exits only as provided in Chapter XI—Exit Requirements.

CHAPTER XXV

PREFABRICATED CONSTRUCTION

2501 — GENERAL

Prefabricated construction shall conform to the requirements of this Code, except as otherwise provided for in this Chapter.

2502 — LOADS

Live, dead and wind load requirements shall conform to the requirements, as set forth in Chapter XII.

2503 — STRUCTURAL DESIGN

Where the size and spacing of framing members on materials is in conflict with, or not covered by this Code, they will be acceptable if the assembly meets the load requirements of this Code, provided they conform to the requirements as set forth for tests under Section 2504.

2504 — TESTS

(a) Every manufacturer of prefabricated construction shall file with the Building Official, duplicate copies of a certificate from a recognized testing laboratory, which states that tests have been made on this particular type of prefabricated construction, and showing the live, dead and wind load capacities in pounds, per square foot, uniformly distributed, together with a detailed physical description of the panels tested.

(b) Panels and other elements tested for loads shall sustain, without failure, for a period of 24 hours, a superimposed load equal to $2\frac{1}{2}$ times the live load. Recovery within 24 hours, after removal of the full test load, shall be not less than seventy-five (75) percent of the observed deflection. The measured deflection of any panel or element under full live load shall be not over one three-hundred-and-sixtieth ($1/360$) of the clear span.

(c) When it is definitely ascertained by the Building Official that the requirements of this Code have been met, a permit shall be issued. A copy of all testing laboratory certifications shall be filed as a permanent record in the office of the Building Official.

2505 — PLYWOOD

Plywood of Douglas fir shall conform to U. S. Commercial Standard CS45-47. Plywood of other species, when used structurally, shall be identified as to veneer grade and glue type by an approved agency and shall meet the performance standards in U. S. Commercial Standard CS45-45 for its type.

Coal, charcoal	10-14
Coal, coke	23-32

APPENDIX "B"

TERMITE CONTROL

Strict adherence to the construction principles incorporated in Chapter XVII will provide termite control adequate for all ordinary conditions.

Where additional protection is desired or necessary, either of the following methods may be used:

1. Metal termite shields of not less than twenty-eight (28) U. S. Standard gauge of galvanized steel sheet or other non-corrodible metal shall extend around the entire perimeter of the building and shall cover all piers, foundation walls or other supporting construction. Such termite shields shall extend not less than two (2) inches beyond the piers or foundation walls on all sides and shall be bent downward at an angle of 45 degrees. All joints in such shields shall be overlapped not less than two (2) inches and soldered.

Shields shall be provided around all service pipes, conduits or

any other possible entrance to upper wood members.

2. Foundation timbers, treated with approved wood preservatives may be used as a termite repellent.

APPENDIX "C" WOOD PRESERVATIVES

All wood preservatives required within the scope of this Building Code shall conform to the following requirements and types of wood preservatives:

1. Creosote oil.

Shall conform to American Wood Preservers Association Specification for Grade 1 Creosote Oil.

2. Preservative salts.

(a) Chromated Zinc Chloride

(b) Wolman Salts

(c) Zinc Meta Arsenite

The above salt treatments are recommended for pressure treatment only in accordance with specifications of the American Wood Preservers Association.

3. Pentachlorophenol:

Shall comply with American Wood Preservers Association Specification P8-48 and Federal Specification TTW570. To be used at a concentration of 5 per cent by weight with a suitable petroleum solvent.

4. Chemonite:

Shall comply with Federal Specification TTW549.

APPENDIX "D"

MINIMUM NUMBER OF CLOSETS AND URINALS REQUIRED SHALL BE IN ACCORDANCE WITH TABLE BELOW:

NUMBER OF PERSONS	MINIMUM NUMBER OF CLOSETS
1 to 9	1
10 to 22	2
23 to 39	3
40 to 60	4
61 to 85	5
86 to 114	6
115 to 147	7
148 to 200	8
Over 200—1 for each additional 50 persons	
1 Urinal shall be provided for each 50 men.

General Requirements	1101 and 1102.
For occupancy groups	Chapter XI

EXIT SIGNS	1117.
------------	-------

EXPLOSIVES—Storage of (See Group H Occupancy)	411.
---	------

EXPOSURES, UNUSUAL, FOR WIND LOADS	1205.7
------------------------------------	--------

EXTERIOR OPENINGS—Protection required	703.1(a)
---------------------------------------	----------

EXTERIOR WALLS

Construction of (see TYPES OF CONSTRUCTION)	
Wind loads on	1205.2

F—OCCUPANCIES (Group F, Storage Occupancy)	409.
--	------

FACED WALLS (see WALLS)

FACTORY	410.
---------	------

FACTORY, HAZARDOUS	411.
--------------------	------

FAILURE TO OBTAIN PERMIT	107.2
--------------------------	-------

FARMER'S MARKET, RAT-PROOF CONSTRUCTION	1902.3
---	--------

FAMILY—Definition of	201.2
----------------------	-------

FEES	107.
------	------

Schedule of permit fees	107.4
-------------------------	-------

Record required of	107.3
--------------------	-------

FENCES

Classed as temporary structures	504.
---------------------------------	------

For construction purposes	2101.3
---------------------------	--------

FILLING STATIONS—Group B Occupancy	405.1
------------------------------------	-------

FILL UNDER FLOOR WITH NON-COMBUSTIBLE	
---------------------------------------	--

MATERIAL	704.2
----------	-------

FILM EXCHANGES

Classed as Group H Occupancy	411.
------------------------------	------

Sprinklers required for	501.3(b)
-------------------------	----------

FILMS—FLAMMABLE

Quantities allowed	501.3
--------------------	-------

Storage and use of	501.3
--------------------	-------

Film vaults	501.3
-------------	-------

FINAL INSPECTION

Made when	108.2(c)
-----------	----------

Required when	108.2(c)
---------------	----------

FINES—For violations	114.
----------------------	------

FIRE

Alarm	1119.
-------	-------

Classification of materials for resistance to (see Chapter X)	
---	--

Extinguishing apparatus (see SPRINKLERS AND STANDPIPES)	
---	--

Separations required—for certain occupancies	412.
--	------

CROSS INDEX

Standards for resistance of (see CHAPTER X)	
FIRE CLAY	
For flue lining	802.
For incinerator combustion chamber	804.3
FIRE DAMAGE	
Causes condemnation, when	101.4
Repairs allowed, when	101.4
FIRE DOORS	703.2 a)
FIRE ESCAPES	1109.
FIRE EXTINGUISHING EQUIPMENT	
Automatic sprinklers—requirements for	901.
Automatic sprinklers—where required	901.
Dry standpipes—requirements	902.
Dry standpipes—where required	902.9
For occupancy groups	301 and 902.
Wet standpipes—requirements	902.
FIRE SHUTTERS	703.2(c)-
FIRE WINDOWS	703.2(d)
FIRE PLACES—Construction of	802.3
FIRE PROOF BUILDINGS (see TYPE I CONSTRUCTION)	602.
FIRE PROTECTION (see TYPES OF CONSTRUCTION)	
Requirements—detailed (see CHAPTER VII)	
FIRE-PROTECTED PASSAGEWAYS AND CORRIDORS	1111.
FIRE-RESISTIVE BUILDINGS (see TYPE II CONSTRUCTION)	603.
FIRE-RESISTIVE RATINGS FOR MATERIALS AND CONSTRUCTION	
General requirements	1001.
Load-bearing wall and partition assemblies	1002.(a)
Non-load-bearing wall	1002.(b)
Protected steel columns	1003.
Reinforced concrete columns, beams, girders, and trusses	1005.
Protected steel beams, girders and trusses	1004.
Protected timber columns	1006.
Floors and roofs	1007.
Materials for fire protection	1008.
FIRE-RESISTIVE STANDARDS	
Construction requirements (see TYPES OF CONSTRUCTION)	
Construction defined	601.
Doors, windows, and shutters	703.
Floor construction	1007.
Inspection of plaster protection, when	1801.
Materials (see CHAPTER X)	

CROSS INDEX

Materials—tests for	1001.
Partitions	1002.
Protection of structural parts (see CHAPTER VI)	
Roof coverings	706.
Walls	1002.
FIRE STATIONS (see GROUP B OCCUPANCY)	405.
FIRESTOPPING	
General	705.
For wood frame construction	1702.6
Masonry construction	705.
Combustible roof construction	705.
Stair stringers	705 and 1702.6
Materials	705 and 1702.6
FIRE DISTRICTS	
Definition of	301.1
Doors may not project	2201.1
Existing buildings	302.
Requirements for Fire Districts Nos. 1, 2, and 3	301.2; 301.3 301.4
FLAG POLES	712.
FLAMMABLE LIQUIDS	
In occupancy groups	501.
Storage for heating purposes	808.
FLAME OPEN—Prohibited when	406.4
FLASHING, Metal	1702.7
FLAT SLAB—General requirements	1601.1(b)
FLOOR AREA	
Definition of	201.2
Limited (see OCCUPANCY AND FIRE DISTRICTS)	
FLOOR CONSTRUCTION	
Concrete (see CHAPTER XVI)	
Fire protection—floors (see TYPES OF CONSTRUCTION)	
Fire-resistive—ratings for	1007.
General (see TYPES OF CONSTRUCTION)	
Laminated (see Footnote 2, SECTION 604.5)	
Mill construction (see TYPE III CONSTRUCTION)	
Motion picture projection booths	512.25
Soil pressure on basement floors	1204.1
Stages	512.19
Steel joists	1511.3
Under warm air furnaces	802.6
Wood joists	1704.
FLOOR FURNACES, GAS	807.2(c)
FLOOR LEVELS	
Determine sprinkler requirements, when	901.
For Groups C and E Occupancies (see OCCUPANCIES)	

CROSS INDEX

FLOOR LOADS

Assumed live	1203.
Definitions of	1203.1(a)
Reductions allowed	1203.1(e)
Required to be posted	110.
Signs required	110.2
Loads in excess of posted capacity	110.3

FLOOR OPENINGS

Enclosures of—when required (see VERTICAL OPENINGS, ENCLOSURE OF)

In stages—construction of	512.19
---------------------------	--------

FLOOR PROTECTION

For wood joisted floor	1701.6
Over heating plants	801.2
Over ranges	807.1(a)
Required in Type V buildings	606.5
Under stoves	807.

FLUES

AREA required	802.2(c)
Lining for chimneys	802.2(a)
Lining for smokestacks	804.4

FLY GALLERIES—Construction of

512.19

FOOTINGS

Concrete—design of (see CHAPTER XVI)	1601.1(b)
Design of—general	1302.3

FORMS

For concrete construction	1605.
May be removed, when	1605.2

FOUNDATION

Permit	106.5
Caissons	1304.
Concrete—design of	1302.3
Construction allowed (see TYPES OF CONSTRUCTION)	
Design of	1302.1
Excavations for	1301.
Footing design—isolated	1302.3
For retaining wall	1302.5
Liability of adjoining property	1301.2
May be omitted in Type VI buildings, when	1701.4
May project beyond property line—when	2203.1
Openings in wall for ventilation	1701.5
Openings in wall for ventilation, rat-proofing of	1901.1
Piling for	1303.
Soil bearing	1302.2
Support of adjoining buildings and structures	1301.2

CROSS INDEX

Walls	1302.5
FRAME BUILDINGS (see TYPE VI BUILDINGS)	
FRAME INSPECTION—Required, when	108.2(c)
FRAMEWORK, OF BUILDING (see TYPES OF CONSTRUCTION)	
FRAMING	
Around chimneys	705.
Of wood construction (see WOOD)	
FREIGHT DEPOTS	409.
Front of lot (definition of)	201.2
FROST	
Depth of foundations for	1302.1
Protection of concrete from	1604.6
FURNACES, FLOOR	807.2(c)
FURNACE AND BOILER ROOMS	801.2
FURNACES, WARM AIR	
Ducts and appurtenances for	805.
General requirements	802.6
Intake required for	805.3
FURRING	
Not allowed near chimney or fireplaces	802.3 and 802.1(b)
Of stucco reinforcement	1807.4
Requirements in wood frame construction (see CHAPTER XVII)	
G—OCCUPANCIES (Group G, Industrial Occupancy)	410.
GARAGE, PRIVATE	
Classified as Group F Occupancy	409.
Definition of	506.1
GARAGE, PUBLIC	
Classified as Group F Occupancy	409.
Construction limited	508.2
Definition of	508.1
Detailed requirement (see Group F)	409.
Ramps for	508.5
Separations required	412.
Ventilation required	508.6
GAS	
Compressed gas systems	808.
Feed lines	809.
Furnaces and boilers	802.6
Floor furnaces	807.2(c)
Heaters, hot water	807.1(c)
Heaters, wall	807.2(b)
Hot plates	807.1(c)
Ranges	807.1(c)

CROSS INDEX

Shut-offs required	809.
Vents—general requirements	802.4
GAS CUTTING OF STEEL	
How performed	1509.2
GASOLINE SERVICE STATIONS (see GROUP B OCCUPANCY)	405 and 505.
GAS SERVICE—SHUT-OFF	
For Group B, C, E, and H Occupancies	809.
GIRDERS	
Concrete (construction joints)	1605.8
Fire protection of concrete girders	1005.
Fire protection of steel girders	1004.
Fire protection of wood girders	1007.
Loads reduced, when	1203.1(e)
Steel	1508.
Wood	1703.3
GLASS BLOCK MASONRY	1410.
GLASS VENEER	1415.6
GRADE	
Brick	1402.1
Ground level, definition	201.2
Lumber	1707.
GRAIN ELEVATORS	411 and 501.4
GRANDSTANDS—Group E Occupancy	408.
GRAVITY TANKS	
For oil burning equipment	501.1(f).
For wet standpipes supply	713.
GREENHOUSE—Roof to be constructed how	509.
GRIDIRONS—Construction of	512.19
GROSS AND NET SECTIONS, STEEL CONSTRUCTION	1508.
Group—A, B, C, D, E, F, G, and H (see CHAPTER IV)	
GROUPS—OCCUPANCY	
Area	404.6 411.5
Automobile ramps	508.5
Automobile storage—limited	506.
Boxes, theater (see GROUP E OCCUPANCY)	
Chimneys and heating apparatus (see CHAPTER VIII)	
Construction	404 to 412.
Definition	401.
Doors	1110.
Dry cleaning—special construction	501.2
Dwellings when on roof (see TYPES OF CONSTRUCTION—PENTHOUSES)	
Enclosure of vertical openings	701.
Exit courts	1102.
Exit facilities (see CHAPTER XI)	

CROSS INDEX

Exit lights	1118.
Exit signs	1117.
Flammable liquids prohibited (see OCCUPANCIES)	
Flammable liquids—storage regulated	501.1(f)
Gasoline filling station	505.
Height	404 to 412.
Light, ventilation, and sanitation	2001.
Location on property (see TYPE VI CONSTRUCTION)	
Mixed occupancies—separations for	412.
Motion picture projection booths—Groups C and E	512.25
Obstructions in exits—Group E	512.18
Prohibited in Fire Districts Nos. 1 and 2	411.
Protection of exterior openings	703.
Ramps required, when	1104.
Running tracks—construction permitted—Groups C and E	512.2
Seats—Group E	512.12
Self-releasing latches or panic bolts, when	1110.
Special hazards (see GROUP H OCCUPANCY)	411.
Special provisions	501.
Sprinklers and standpipes (see CHAPTER IX)	
Stage construction—Groups C and E	512.19
GROUT	1412.2
GROUTED MASONRY	1412.
GUTTERS—To be kept free of obstructions, when	2101.1(b)
GYMNASIUMS (see GROUP E OCCUPANCY)	
GYMNASIUMS—Special Construction (see TYPES OF CONSTRUCTION)	
GYPSUM	
Blocks for fire-resistive construction	1002.
Concrete	1414.
Fire-resistive classifications (see CHAPTER X)	
Masonry	1402.10
Plaster, application	1806.1
Plaster, lath	1803.3
Plaster, mix	1806.1
Plaster, Vermiculite	1806.2
H—OCCUPANCIES (Group H, Special Hazardous Occupancy)	411.
HALLS, ASSEMBLY	408.
HANGARS, AIRPLANE	409.
HANGERS REQUIRED—For joists	1703.4
HAZARDOUS OCCUPANCIES	411.
HEADER—IN FRAME CONSTRUCTION	
Joists—support required	1704.3
Over opening in stud partitions	1702.3

CROSS INDEX

HEATING DUCTS	805.
HEATERS	
General Requirements	807.
Using gas for fuel	807.1(c)
Using solid or liquid fuel	807.1(b)
HEATING PLANTS—LOW PRESSURE STEAM	802.6
HEAVY TIMBER CONSTRUCTION (see TYPE III CONSTRUCTION)	604.
HEIGHT	
Additional for roof structures	402.3 and 402.5
Affects stairways required	1108.
Definition of	201.2
For awnings	2201.2 and 2201.3
For occupancy groups	404 to 412.
For marquees above sidewalk	2201.2
For permanent projections over property line	2201.
For Types I, II, III, IV, V and VI	404 to 412.
Of masonry walls (see WALLS)	
Raising adjoining chimneys and vents	802.1(e)
Towers or spires	402.3
Veneered walls	1415.2 and 1415.3
HOLLOW CLAY TILE (see STRUCTURAL CLAY TILE)	
HOLLOW CONCRETE BLOCK OR TILE (see CONCRETE BLOCK)	
HOLLOW MASONRY	
Units	1402.2
Walls, working stresses	1403.
Walls, thickness	1404.
HOODS	
Definition of	801.1
Range	807.1(a)
HORIZONTAL EXITS	
General requirements	1105.2
Signs for	1117.
Substitute for stairways, when	1105.2
HOSE—As equipment for wet standpipe	902.8
HOSE CONNECTIONS	
To standpipes	902.6
HOSPITALS—Group D Occupancy	407.
HOTELS—Group A Occupancy	404.1
HOT PLATES—Using gas	807.1
HOUSES OF CORRECTION (see GROUP D OCCUPANCY)	
ICE PLANTS (see GROUP G OCCUPANCY)	
INCINERATORS	
Chimneys	802.
Construction of	804.3

CROSS INDEX

INFLAMMABLE LIQUIDS (see FLAMMABLE LIQUIDS)	
INNER COURT WALLS (see TYPES OF CONSTRUCTION)	
INSPECTION	108.
For change of occupancy	109.
Of fire doors by Underwriters' Laboratories	703.2(a)
Of plans	105.6
Of plastering	1801.
Of roofing by Underwriters' Laboratories	706.
Of windows by Underwriters Laboratories	703.2(a)
Required when	108.2
INSULATING MATERIAL—Regulations for	704.
INTERIOR TRIM	
For Type I buildings	704.4
For Type II buildings	704.4
INTERPRETATION OF CODE	
By Board of Adjustments and Appeals	113.1
JAILS—Group D Occupancy	407.
JOINTS IN STEEL (see STEEL—STRUCTURAL)	
JOINTS IN WOOD	
Bolts	1706.6
Nails	1706.
Timber connectors	1706.7
Washers	1706.5
JOIST HANGERS	1703.1
JOISTS	
Fire protection of wood	1703.4
Steel	1511.3
Wood	1704.
Wood—header and trimmer	1704.3
LAMINATED FLOORS (see Footnote 2)	604.5
LANDING OF STAIRS	1108.4
LATERAL BRACING	1702.6
LATH	
Paperback Wire	1802.4(b)
Fiber board	1802.2
Gypsum	1802.3
Metal (see METAL OR WIRE LATH)	1802.4(a)
LATH, APPLICATION OF (see PLASTER AND LATHING)	
LIBRARIES—Group E Occupancy	408.
LIGHT, NON-COMBUSTIBLE FRAME (see TYPE IV CONSTRUCTION)	
LIGHT STEEL CONSTRUCTION	1511.
LIGHT	
During construction red lights required	2101.8
For exit signs	1117.
For occupancy groups	1118.

CROSS INDEX

For public safety during moving of buildings	2204.6
For Group C Schools	406.4
For stairways and exits	1118.
LIME	
Proportions for plaster	1807.5
Proportions for mortar	1402.16
LINING	
Of chimneys	802.
Of smokestacks	804.4
LINTEL	
Definition of	201.2
Fire protection omitted when	608.2
LIQUIDS (see FLAMMABLE LIQUIDS)	
LIVE LOADS	
Concentrations of	1203.1(d)
Definition of	1203.
Impact, crane runways	1203.4
Items not specifically covered	1203.1(b)
Load tests	1203.5
For roofs	1203.2
Other live loads	1203.3
Reductions allowed	1203.1(e)
Required to be posted	110.
Unit—for certain occupancies	1203.
LOADING PLATFORMS (see PUBLIC GARAGES)	508.3
LOADS (see LIVE AND DEAD LOADS)	
For retaining wall design	1204.1
Piles—bearing power of	1303.1(b)
Soil—bearing capacity of	1302.2
Stresses during erection	1205.10
Wind pressure	1205.
LOBBIES IN THEATERS	
Obstructions	512.7
Size required	512.6
LOCATION IN FIRE DISTRICTS	
Fire Districts Nos. 1, 2, and 3	301.
LOCATION ON PROPERTY	
Type VI Construction	607.
LOCATION OF STANDPIPES	902.5
LODGES—Group E Occupancy (see ASSEMBLY BUILDINGS)	408.
LODGING HOUSE—Group A Occupancy	404.
LOT LINES (see LOCATION ON PROPERTY, TYPE VI CONSTRUCTION)	607.
LUMBER (See WOOD)	

CROSS INDEX

MANUFACTURING PLANTS—Group G Occupancy	410.
MAINTENANCE	
Of buildings or structures	101.5
Of present safety devices	103.4
MARBLE VENEER	1416.
MARKETS—Group B Occupancy	405.1
MARKETS—RAT-PROOF CONSTRUCTION	1902.
MARQUEES	2201.2
MASONRY	
Architectural terra cotta	1402.8
Aggregate	1402.13
Brick	1402.1
Clay or shale units	1402.2
Cast stone	1402.5
Concrete, plain	1402.6
Construction, rat-proofing of	1902.1
Erection	1409.11
Glass block	1410.
Glazed building units	1402.9
Grouted	1412.
Gypsum	1402.10
Hollow units	1402.4
Lateral support	1405.
Materials	1402.
Minimum wall thickness	1404.
Mortar	1402.16
Ordinary (see TYPE V CONSTRUCTION)	
Piers	1409.7
Quality and design (see CHAPTER XIV)	
Reinforced	1413.
Tests required	1401.
Stone	1402.7
Veneered walls	1415.
Walls and partitions (see WALLS)	
Working stresses	1403.
MASONRY VENEER	1415.
MATTRESS FACTORIES (see GROUP H OCCUPANCIES)	
MEASUREMENT OF HEIGHTS	
Of buildings (see definition of HEIGHT)	404 to 412.
MECHANICAL VENTILATION (see VENTILATION)	
METAL	
As lath (see METAL OR WIRE LATH)	
As roof covering	706. and 1705.3(h)
Exterior wall veneer	1415.4
Frames with wire glass	707 and 703.2(d)
Gas vents of	802.4

CROSS INDEX

Required for doors in rat proof construction.....	1901.1(c)
Smokestacks of.....	804.4
METAL FRAME BUILDINGS (see TYPE IV BUILDINGS)	
METAL OR WIRE LATH	
For fire resistive construction.....	1008.6
For exterior and interior plastering.....	1802.4 and 1803.5
For stucco reinforcing.....	1807.
METHODS OF CALCULATING LOADS (see CHAPTER XII)	
MEZZANINE OR MEZZANINE FLOOR	
Construction for Type I buildings.....	602.5
Construction for Type II buildings.....	603.5
Definition of.....	201.2
Shall not be counted as a story when.....	402.4
MILLS—Group G Occupancy	410.
MINIMUM REQUIREMENTS	
For classification by type of construction.....	601.1
For fire protection of structural parts (see CHAPTER VI)	
MIX	
For masonry mortars.....	1402.16
For reinforced concrete.....	1603.3
MIXED OCCUPANCIES—Separations required	412.
MONASTERIES—Group A Occupancy	404.1
MORTAR	
For masonry construction.....	1402.16
For reinforced masonry.....	1413.3
MOTION PICTURE PROJECTION BOOTHS	
Construction and design.....	512.25
For Group C and E Occupancies.....	512.25
MOTION PICTURE FILMS—Storage and handling of	512.25
MOTION PICTURE THEATERS—Group E Occupancy	408.
MOVING—OF BUILDINGS	
Permit required for.....	105.1
Regulations governing movement of buildings.....	2204.
When in Fire Districts Nos. 1, 2, and 3.....	301.
MUDSILL—Allowed when	1701.4
MULTIPLE DWELLINGS—Group A Occupancy	404.1
MUSEUMS (see ASSEMBLY BUILDINGS)	
NATIONAL BOARD OF FIRE UNDERWRITERS	
Class A ,B, and C roof coverings required.....	706.
Storage and handling of flammable materials.....	501.1(f)
NEW MATERIALS OR METHODS	
NIGHT LIGHTS—For stairs and exits	1118.
NON-BEARING WALL (see WALLS)	
Non-Combustible frame construction (see TYPE IV CONSTRUCTION)	605.

CROSS INDEX

NOTICES

For inspections by Building Official	108.2
Of appeals	112.1
Permit card shall be posted	108.2(b)
Of approval on permit card	108.2(b)
Of condemnation	103.4
Of approval required	108.2(d)
Of violations	103.2

OBSTRUCTIONS—PROHIBITED

As locks on doors	1110.
At fire doors	1110.
At horizontal exits	1113.
In exit outlets	1107.
In street gutter—when	2101.1(b)
In stairways	1108.6
On sidewalks	2202.2

OCCUPANCY

Certificate of	109.
Contents of Certificate of Occupancy	109.2
Change in use	109.1
Classified how	401.1
Definition of	201.2
Existing buildings	109.4
Mixed	412.

Occupancy Groups (see CHAPTER IV)

Group A, Residential Occupancy	404.
Requirements	404.2-404.4
Group B, Business Occupancy	405.
Requirements	405.3-405.5
Group C, School Occupancy	406.
Requirements	406.2-406.5
Group D, Institutional Occupancy	407.
Requirements	407.3-407.5
Group E, Assembly Occupancy	408.
Requirements	408.4-408.6
Group F, Storage Occupancy	409.
Requirements	409.2-409.4
Group G, Industrial Occupancy	410.
Requirements	410.2-410.4
Group H, Special Hazardous Occupancy	411.
Requirements	411.2-411.5

Mixed occupancy and separation requirements	412.
Permanent—of public property	2201 and 2204.
Separations required	412.
Temporary—allowed	109.3

OFFICE BUILDINGS—Group B Occupancy	405.1
OFFICIAL, BUILDING (see BUILDING OFFICIAL)	

CROSS INDEX

OIL

Storage of (in occupancy)..... 501.1(f)

OLD PEOPLE'S HOMES—Group D Occupancy..... 407.

OPENINGS

Communications, through occupancies..... 412.6

Exterior—to be protected when..... 703.1

In stairways or shaftways..... 703.6

Vertical—to be protected when..... 701.

ORDINARY MASONRY BUILDINGS (See TYPE V CONSTRUCTION)..... 606.

ORIEL WINDOW, construction of..... 710.

ORPHANAGES—Group D Occupancy..... 407.

OUTLETS, EXIT..... 1107.

OUTSIDE STAIRWAYS..... 1109.

OVERCROWDING PROHIBITED

In Groups C and E Buildings..... 408.3

Placard indicating capacity required..... 512.17

Where movable seats are used..... 408.3

OVERLOADS OF FLOORS—Not permitted..... 1207.

OVERTURNING MOMENT—For wind calculations..... 1205.9

OWNER

May occupy space under sidewalk, when..... 2203.1

Occupies building, when..... 109.1

Permits storage of materials in street—when..... 2101.1

Required to post signs..... 110.1; 512.17; 512.16; 902.7; 1117; 1120.

Required to repair buildings when..... 101.4 and 101.5

Responsibility of, when adjoining..... 412; 802.1(e); 1301.2

PAINT SHOPS (see GROUP H OCCUPANCY)

PAINT STORAGE (see GROUP H OCCUPANCY)

PANEL WALLS (see WALLS)

PANIC BOLTS

For exit doorways..... 1110.

For stairway enclosures..... 1110.

PAPER—WATERPROOF Required when..... 1807.3

PARAPET WALL

Definition of..... 201.2

For Type I, II, and III Buildings (see TYPES OF CONSTRUCTION)

PARKING LOTS—Group B Occupancy..... 405.1

PARTITIONS

Bearing—combustible..... 1702.2

Bearing—incombustible..... 1002.

Enclosure of vertical openings..... 701.

Fire ratings for partition assemblies..... 1002(a) and 1002.(b)

For frame construction..... 1702.2

CROSS INDEX

General (see TYPES OF CONSTRUCTION)	
Non-bearing—incombustible	1002.
Other requirements	702.
Temporary	1203.1(d)
PARTY WALL—Definition of	201.2
PASSAGEWAYS—Required for stairways, when	1102.
PASSENGER STATIONS—Group E Occupancy	408.
PATENT CHIMNEYS (see METAL CHIMNEYS)	
PEDESTAL	
Concrete—definition of	1601.4
Concrete—design of	1601.1(b)
PENALTIES AND VIOLATIONS—Provided by Code	114.
PENTHOUSE—General requirements (see TYPES OF CONSTRUCTION)	
PERMIT	
Application for	105.
Does not permit violation	106.2
Expires when	106.2
Fees for	107.4
For alteration	105.1
For change of occupancy	109.
For demolishing	105.1
For moving	105.1
For new buildings or structures	105.1
For storage of construction materials in street	2101.1
For temporary buildings	504.1
For use or occupancy	109.
Not valid, when	106.2
Plans required for	105.3

CROSS INDEX

Walls (see WALLS)	
Working stresses	1603.
PLAIN MASONRY	1401.
PLANING MILLS (see GROUP G OCCUPANCY)	
PLANTS, MANUFACTURING	410.
PLANS	
Approved by Building Official	105.6
Required for permit when	105.3
Shall bear name of whom	105.6
Show water-cement ratio, when	1603.2
PLASTER AND LATHING	
General requirements, lathing and plastering	1800.1
Materials:	
Fiber insulation lath	1802.2
Gypsum lath	1802.3
Gypsum plaster	1802.5
Metal lath	1802.4
Portland cement	1802.7
Sand	1802.6
Wood lath	1802.1
Lathing, interior—application of:	
Fiber insulation lath	1803.4
Gypsum lath	1803.3
Metal lath	1803.5
Angle and joint reinforcement	1803.6
Spacing of supports	1803.1
Wood lath	1803.2
Lathing, interior—contact, furred and suspended ceilings:	
Contact ceilings	1805.2
Cross furring	1805.4
Hangers and attachment	1805.1
Main runners	1805.3
Stucco—application and curing	1807.6
PLATE GIRDERS	1508.
PLYWOOD—For exterior sheathing	1705.3(c)
POLICE STATIONS (see GROUP B OCCUPANCY)	
PORTLAND CEMENT	
For plaster	1802.7
In masonry mortar	1402.12
Specifications for	1402.12
Storage of	1602.8
POWER PLANTS (see GROUP G OCCUPANCY)	
PREFABRICATED CONSTRUCTION	2501.
PRESSURE TANKS—For wet standpipe supply	713.
PRINTING PLANTS (see GROUP G OCCUPANCY)	
PRISONS—Group D Occupancy	407.
PRIVATE GARAGE (see GARAGE, PRIVATE)	

CROSS INDEX

PROCESSING PLANT	410.

5	1400	2300	8.2	3.3	4.2	8.2	3.1	4.2	7.3	2.9	4.1
4½	1000	1800	9.2	3.7	4.6	9.2	3.5	4.6	8.2	3.4	4.5
4	700	1300	10.5	4.3	5.2	10.5	4.0	5.2	9.3	3.9	5.1
Assumed Moisture			4½%	0.0		4½%	0.0		4½%	0.0	1½%

Compressive Strengths for the above water-cement ratio are based on 3-inch slump concrete.

NOTE: To apply the tables where arbitrary volumetric proportions are to be met, the following cement factors should be used to determine quantities of materials for various nominal volumetric mixes:

Volumetric Proportions	Total Parts of Aggregate	Cement Sacks Per Cubic Yard
1 : 2 : 3	5	7
1 : 2 : 3½	5½	6.3
1 : 2 : 4	6	6
1 : 2½ : 4	6½	5½
1 : 2½ : 5	7½	5
1 : 3 : 5	8	4½
1 : 3 : 6	9	4

The Quality of Exterior Plywood is Constantly "Performance Tested"

RIGID quality tests—under U. S. Commercial Standard CS45—constantly prove the durability of Exterior-type Douglas fir plywood.

Exterior-type plywood has been thoroughly proved in hundreds of thousands of applications, too. It serves as siding for homes and commercial buildings. It's used for boats, railroad cars, truck bodies, farm structures.

Douglas fir plywood is accepted in the Uniform Building Code, the new Basic Building Code, the Southern Building Code, many individual city codes...and permitted for siding of homes financed through F. H. A.

TYPES TO MEET USE NEEDS

EXTERIOR-TYPE Douglas fir plywood, bonded with completely waterproof phenolic resin adhesive, is manufactured in several appearance grades. PlyShield is the grade for siding and most other exterior uses.

INTERIOR-TYPE Douglas fir plywood is bonded with highly moisture-resistant (but not waterproof) glue. Appearance grades for sheathing, subflooring, interior paneling, concrete forms, wall-to-wall floor covering base.

Douglas Fir Plywood

Data For You

Available without charge: Special assembly, "Plywood Data for Building Code Authorities". Also, basic catalog, U. S. Commercial Standard for fir plywood and "Plywood Today", a comprehensive review of building uses. Write Douglas Fir Plywood Association, Tacoma 2, Wash.

AMERICA'S BUSIEST
BUILDING MATERIAL

WARNING—

With the tremendously rapid growth in popularity of red cedar shingles and processed shakes for exterior wall construction, faulty application has become a major problem in some sections of the Southland. Inexperienced applicators have been found to be unfamiliar with recommended application practices. For a satisfactory wall that will last the life of the house, certain fundamental rules of construction must be followed.

To Building Officials, Architects and Contractors, we offer free of charge and without obligation one or more copies of the 100-page Certigrade Handbook, which contains full and complete specifications on the proper usage of cedar shingles for roofs and walls. Yours free for the asking—we are anxious to serve you in all ways possible in promoting better housing in America.

NATIONAL SLAG ASSOCIATION

644 Warner Bldg. - Wash. 4, D. C.

The National Slag Association offers its services to builders, architects, engineers, city and building officials throughout the South, as well as the Nation, for the proper application of Blast Furnace Slag in the use of building construction.

To facilitate our services, those interested are referred to our Southern Members.

1949 BOOK OF A.S.T.M. STANDARDS

Over 8000 pages — Six Parts — Over 1600 Standards
(Specifications, Tests, Definitions, etc.)

PART 1. Ferrous Metals. 275 Standards, 1400 pages.

PART 2. Non-Ferrous Metals. 240 Standards, 1170 pages.

PART 3. Cement, Concrete, Ceramics, Thermal Insulation, Road and Waterproofing Materials, Soils. 340 Standards, 1370 Pages.

PART 4. Paint, Naval Stores, Wood, Adhesives, Shipping Containers, Paper. 325 Standards, 1320 pages.

PART 5. Textiles, Soap, Fuels, Petroleum, Aromatic Hydrocarbons, Water. 330 Standards, 1730 pages.

PART 6. Electrical Insulation, Plastics, Rubber. 240 Standards, 1410 pages.

Each Part has a detailed subject index and 2 tables of contents, arranged to make the Book as usable as possible.

PRICES: Parts 1, 5, 6	\$10.00 each
Parts 2, 3, 4	\$ 8.00 each
Complete Set	\$54.00

A complete Index to Standards is furnished with the Books, no charge.
Each of the some 1600 A.S.T.M. Standards is available in separate pamphlet form at nominal cost (most items at 25 cents each) and several special compilations of Standards are available.

A complete list of publications and other information gladly furnished on request.

A Message to

ARCHITECTS ENGINEERS BUILDERS

THROUGH its extensive research and especially trained technical staff, the Portland Cement Association is ready and anxious to help you with your concrete design and construction problems.

Our purpose is to aid designers and builders to get the maximum service—fire safety, durability and low annual cost—which concrete construction has to offer.

Whether in schools or churches, hospitals or hotels, factories or homes, waterworks or sewer systems, properly designed and built concrete structures are moderate in first cost and very low in annual cost.

Do not hesitate to consult us on concrete and reinforced concrete design and construction problems.

Southwest Research Institute	San Antonio, Texas
Underwriter's Laboratories	Chicago, Illinois

BUILDING RESEARCH

The Southern Building Code Congress welcomes an opportunity to work with any State University or other agency who is developing building research which may prove instrumental in reducing housing and building costs in the South on a sound basis. The Southern Code has but one purpose, that is to give our cities modern building regulations maintained up to date and to lower building costs by opening the doors to progressive research. Building research would be of little consequence without opening the doors to that research in our building regulations. Among those institutions who are doing much in this direction at this time are:

National Bureau of Standards	Washington, D. C.
Southern Research Institute	Birmingham, Ala.
Southwest Research Institute	San Antonio, Texas
Louisiana State University	Baton Rouge, Louisiana
Alabama Polytechnic Institute	Auburn, Alabama
Vanderbilt University	Nashville, Tennessee
University of Texas	Austin, Texas
University of Tennessee	Knoxville, Tennessee
Georgia Tech	Atlanta, Georgia
University of South Carolina	Columbia, South Carolina
University of North Carolina	Chapel Hill, North Carolina
University of Virginia	Charlottesville, Va.
University of Florida	Gainesville, Florida
University of Oklahoma	Norman, Oklahoma
University of Arkansas	Fayetteville, Arkansas

MATERIAL TESTING

Pittsburgh Testing Laboratory
Southern Testing Laboratory

CODE CHANGE PROCEDURE

Southern Standard Building Code

FORM

1. Submit in writing at least two copies of proposed recommended revision, addition or change to the Southern Building Code Congress, Brown-Marx Building, Birmingham 3, Alabama.
2. Do not submit a proposed change in specification form but rather by section or sub-section of the Southern Code with change included.

NOTIFICATION

All proposed revisions are printed in SOUTHERN BUILDING Magazine and distributed at least thirty days prior to an annual meeting to all cities and officials of the organization.

OPEN HEARING

At each annual meeting an open hearing is held on each proposed change by the Building Research and Revision Committee with the Code Engineering Committee acting as an Advisory Committee.

FINAL APPROVAL

If, by a majority vote the Research Committee approves a change, such change must be ratified by a majority vote of membership cities, in which case the revision is final and therefore included in the next printing of the Code. The Code Change Committee checks the intent and editorial content of each change after final approval.

APPEAL

In the event a proposed change is rejected by the Research Committee, the proponent may appeal to the Board of Trustees, who may authorize a rehearing or a direct vote from membership cities.
